Abstract:

Diarylethene-containing ligands and their coordination compounds are described. The ligands display photochromism with UV excitation, while the coordination compounds display photochromism with both excitation in the UV region and excitation into lower energy absorption bands characteristic of the coordination compounds, through which the excitation wavelengths for the photoisomerization can be extended from λ≤340 nm to wavelengths beyond 470 nm. Switching of the luminescence properties of the compounds has also been achieved through photochromic reactions.

1 PHOTOCROMIC DIARYLETHENE-CONTAINING COORDINATION COMPOUNDS AND THE PRODUCTION THEREOF

CROSS REFERENCE TO RELATED APPLICATIONS

This application is a continuation-in-part of U.S. patent application Ser. No. 10/883,677 filed Jul. 6, 2004 now U.S. Pat. No. 7,355,755, which claims the benefit of U.S. provisional patent application No. 60/484,668 filed Jul. 7, 2003, the entirety of both disclosures being incorporated herein by reference.

FIELD OF THE INVENTION

This invention is related to the design and the photochromic behavior of novel photochromic ligands and their coordination compounds. The design of these photochromic ligands and their coordination compounds is based on the cis-diarylethene structure, which forms part of a mono- or poly-cyclic ring structure that contains one or more donor atom(s) or donor heteroatom(s) for coordination to an acceptor atom to form photochromic coordination compounds.

BACKGROUND OF THE INVENTION

Photochromism is defined as "a reversible transformation of a single chemical species being induced in one or both directions by absorption of electromagnetic radiation, with two states having different distinguishable absorption spectra." Thus, photochromic compounds are compounds that possess at least two isomeric forms which have different physical properties, such as absorption properties, reflectivity, and the like, and can be transformed from one form to another by light excitations at prescribed wavelengths.

Photochromism has been intensively studied due to its potential use for optical recording and other optical functioning devices. To be practically used as optical recording materials, both isomeric forms must be thermally stable and possess excellent durability for reversible photochromic reactivity. Diarylethenes are a class of photochromic compounds which possesses these properties, and therefore is a suitable class of compounds for the construction of optical functioning devices. The cis-configuration of both aryl groups in the diarylethenes studied is generally fixed by an upper cycloalkene structure, such as fluorinated allylic group, aromatic group, anhydride and maleimide group. Apart from the difference in absorption characteristics and the like between the two forms and their thermal stabilities, the availability of desirable excitation wavelengths that can be tuned and selected for the photochromic reactions also represents an important aspect in the design of materials for optical functioning devices. It has been shown that with the more π-conjugated upper cycloalkene structures, such as maleimide derivatives, in the diarylethenes compounds, the photocyclization proceeds at lower energy excitation in the region of the visible light.

SUMMARY OF THE INVENTION

The present invention relates to the use of coordination compounds to perturb the properties of the diarylethenes in photochromic compounds. Described below is a report of the design, synthesis and studies of cis-diarylethene-containing ligands, with the upper cycloalkene being part of a mono- or poly-cyclic ring structure that contains one or more donor atom(s) or donor heteroatom(s), such as phenanthrolines, pyridines, imidazoles, pyrazoles, thiazoles, pyroles, diazines, triazines, polypyridines, porphyrins and phthalocyanines and the like, for coordination compound formation.

The object of the present invention is to provide a new class of diarylethene-containing coordination compounds capable of displaying perturbed and sensitized photochromic properties. The invented photochromic compound is a coordination compound that contains a diarylethene with one or more donor atoms coordinated to an acceptor atom of the coordination compound. Any diarylethene in which the ethene group is a heterocyclic moiety, monocyclic or polycyclic, with any donor atom(s) capable of forming a coordination compound can be used in the present invention. There is no restriction on the nature of the aryl groups and they can be heterocyclic groups such as, for instance, thiophenyl groups. Likewise, any acceptor atoms which can be coordinated with the ethene-containing heterocyclic moiety can be employed.

In a preferred form, the photochromic coordination compound is expressed by the following general formula (I):

![Diagram]

where unit B represents a mono- or poly-cyclic ring structure, such as phenanthroline, pyridine, imidazole, pyrazole, thiazole, pyrrole, diazine, triazine, polypyridine, porphyrin and phthalocyanine and the like, that contains one or more donor atom(s) X, such as carbon, or donor heteroatom(s) X, such as nitrogen, oxygen, sulfur, phosphorus, silicon, i.e., is integer from 0 to 3. (M) represents the coordination unit containing an acceptor atom M, such as rhenium(I), zinc(II), rhenium(I), osmium(II), rhodium(III), iridium(II), gold(III), gold(I), silver(I), copper(I), copper(II), platinum(II), palladium(II), iron(II), cobalt(III), chromium(III), cadmium(II), copper(II) and the like, R₁ and R₂, individually represent alky groups and alkoxy groups, and R³ to R₄, individually represent atoms or groups selected from the group of hydrogen atom, halogen atom, hydroxyl group, alkyl group, alkoxy group, alkynyl group, cyano group, nitro group, alkeny carbonyl group, alkylcyarno group, perfluoroalkyl group, aryl group, cycloalkyl group, arylcyarno group, aryloxy carbonyl group, mono- or dialkylaminocarbonyl group, alkylcarbonyl oxy group, aryloxy carbonyl group, aryloxy carbonyl group, alkoxy carbonyl group, aryloxy carbonyl group, and the like. In general, any alkyl or alkoxy group contains 1 to about 20 carbon atoms, any cycloalkyl group contains 3 to 8 carbon atoms, and any aryl group contains 6 to about 20 carbon atoms.
3

A non-limiting list of examples of diarylethene compounds containing a heterocyclic ethene-containing ligand moiety includes 5,6-dithienyl-1,10-phenanthroline, 2,3,7,8,12,13, 17,18-octathietyl-5,10,15,20-tetraphenyl porphyrin, 6,7-dithienyl-dipyrido[3,2-a:2',3'-e]phenazine and the like.

A non-limiting list of coordination units includes chlorotricarbonyliridium(I), dithiolatolozinc(II), dihydroplatinum(II), biprylidiphenylrhodonium(II), diphosphonicopper(II), bipyridyleopper(II) and the like.

One of the advantages of the formation of coordination compounds from their pure organic counterparts (free ligands) in this invention is the extension of the excitation wavelength for the photocyclization of the diarylethene moiety from λ≤340 nm to lower energy, so that the photochronic forward reaction can proceed with visible light excitation by utilization of the low-energy absorptions characteristic of coordination compounds. In addition, the photochronic reactions can be utilized to switch the photoluminescence properties characteristic of the coordination compounds.

**BRIEF DESCRIPTION OF THE DRAWINGS**

**FIG. 1** shows a representative synthetic route for a diarylethene-containing ligand and its coordination compounds using 5,6-dithienyl-1,10-phenanthroline and its chlorotricarbonyliridium(I) and dithiolatolozinc(II) compounds as illustrative examples.

**FIG. 2** shows the overlaid electronic absorption spectra of the open form (-) and the close form (---) of a diarylethene-containing nitrogen donor ligand (L1).

**FIG. 3** shows the overlaid electronic absorption spectra of the open form (-) and the close form (---) of a diarylethene-containing coordination compound (1).

**FIG. 4** shows the photochronic reactions of (a) a diarylethene-containing ligand and (b) its coordination compound using 5,6-dithienyl-1,10-phenanthroline and its chlorotricarbonyliridium(I) compound as illustration.

**FIG. 5** shows the overlaid corrected emission spectra of the open form (-) and the close form (---) of (1) in benzene solution at 298 K.

**FIG. 6** shows the overlaid corrected emission spectra of the open form (-) and the close form (---) of (1) in EthOH-MeOH (4:1) v/v at 77 K.

**FIG. 7** shows the absorption spectral changes of complex (4) in benzene upon excitation at λ=500 nm.

**FIG. 8** shows a representative synthetic route for a diarylethene-containing ligands and their coordination compounds using 1-(aryl)-bis(2,5-dimethyl-3-thienyl)-2-(2-pyridyl)imidazoles and their chlorotricarbonyliridium(I) compounds as illustrative examples.

**FIG. 9** shows (a) the absorption and (b) emission spectral changes of complex (5) in degassed chloroform solution (7.16×10^{-4} M) upon MLCT excitation at λ=410 nm.

**FIG. 10** shows a representative synthetic route for a diarylethene-containing ligand and its coordination compounds using 1,3-dimethyl-4,5-bis-(2,5-dimethyl-3-thienyl)imidazolium hexafluorophosphate and its diiodopalladium(I) compounds as illustrative examples.

**FIG. 11** shows the absorption spectral changes of complex (7) in dichloromethane solution (1.21×10^{-4} M) upon excitation at λ=310 nm.

**FIG. 12** shows a representative synthetic route for diarylethene-containing ligand and its coordination compounds using 5-ethyl-2,3-bis(2-methyl-3-benzothiophenyl) thiophene and its bis(triethylphosphine)platinum(II) compounds as illustrative examples.

**FIG. 13** shows the absorption spectral changes of complex (8) in dichloromethane solution (3.10×10^{-4} M) upon excitation at λ=400 nm.

*Values reported are corrected to the ratio of the photochronic active configuration, i.e. with respect to the anti-paranicl configuration.*

The photoluminescence properties of both the open and close forms were measured. FIGS. 5 and 6 display the overlaid emission spectra of the open form and the close form of complex (1) in benzene at 298 K and in EthOH-MeOH glass (4:1 v/v) at 77 K. The emission of complex (1) was found to change by metal-to-ligand charge transfer (MLCT) phosphorescence to ligand-centered (LC) phosphorescence upon photocyclization of the open form to the close form. These demonstrate the change of emission properties upon photochronic reactions. Table 4 summarized the emission data of ligand (L1) and complex (1).

Example 4

The ligand, 1,3-dimethyl-4,5-bis(2,5-dimethyl-3-thienyl)-imidazolium hexafluorophosphate (L4), is synthesized by the methylation of 4,5-bis(2,5-dimethyl-3-thienyl)-1H-imidazole, which is also prepared using Suzuki cross-coupling reactions of 2,5-dimethyl-3-thienylboronic acid and 2,5-dibromo-1H-imidazole in the presence of the palladium catalyst, Pd(PPh3)4, and sodium carbonate in a heterogeneous mixture of water and THF according to the procedure similar to that of (L1), as depicted in FIG. 10. Excitation of the ligand with  290 nm light resulted in the formation of the close form, corresponding to the photocyclization product.

Example 3

Those skilled in the art will recognize that various changes and modifications can be made in the invention without departing from the spirit and scope thereof. The various embodiments described were for the purpose of further illustrating the invention and were not intended to limit it.

Example 5

The ligands, 1-(4-methoxyphenyl)-bis-(2,5-dimethyl-3-thienyl)-2-(2-pyridyl)imidazole (L2) and 1-(4-methylphenyl)-bis-(2,5-dimethyl-3-thienyl)-2-(2-pyridyl)imidazole (L3), are synthesized by Suzuki cross-coupling reactions of 2,5-dimethyl-3-thienylboronic acid and 1-aryl-4,5-dibromo-2-(2-pyridyl)imidazole in the presence of the palladium catalyst, Pd(PPh3)4, and sodium carbonate in a heterogeneous mixture of water and THF according to the procedure similar to that of (L1) as depicted in FIG. 8. Excitation of (L2) and (L3) with 313 nm light resulted in the formation of the close form, corresponding to the photocyclization product.

Similar to ligand (L1), upon coordination of (L2) and (L3) to chlorotriacarbonylchromium(I) complex, the open form of the corresponding complexes (5) and (6) undergo photocyclization with the excitation of both the intraligand absorptions at 270 and 370 nm and the metal-to-ligand charge transfer (MLCT) absorption characteristic of this coordination compound up to 570 nm. The electronic absorption data of ligands (L2)–(L3) and complexes (5)–(6) are summarized in Table 6. Apart from the change in the absorption properties, the emissions of all the complexes were also found to drop significantly upon conversion to the close form. These further illustrate the change of emission properties upon photochromic reactions. The representative emission and electronic absorption spectral changes of the open form in chloroform solution upon photo-irradiation are shown in FIG. 9.

Example 5

5-Trimethylisobenzofuran-2,3-bis(2-methyl-3-benz0[3,2-b]thienyl)thiophene is synthesized by the Sonogashira coupling reaction of trimethylisobenzofuran and the bromo-derivative of 2,3-bis(2-methyl-3-benz0[3,2-b]thienyl)thiophene, which is also prepared from the Suzuki cross-coupling reaction of 2,5-dimethyl-3-thienylboronic acid and 2,5-dibromothiophene in the presence of the palladium catalyst, Pd(PPh3)4, and sodium carbonate in a heterogeneous mixture of water and THF according to the procedure similar to that of (L1). Subsequent deprotection of the trimethylsilyl group using potassium carbonate in dichloromethane solution gives the target ligand ethynyl-2,3-bis(2-methyl-3-benz0[3,2-b]thienyl)thiophene (L5). The synthetic route is shown in FIG. 12. Excitation of the ligand with  352 nm light resulted in the formation of the close form, corresponding to the photocyclization product.
Upon reaction with dichlorobis(triethylphosphine)platinum(II), the open form of the corresponding complex (8) undergoes photocyclization with the excitation up to λ ≤ 430 nm. The electronic absorption data of ligand (1.5) and complex (8) are summarized in Table 8. The representative electronic absorption spectral changes of complex (8) in dichloromethane solution upon photo-irradiation are shown in FIG. 13.

What is claimed is:
1. The photochromic compound which is a diarylethene-containing coordination compound in which the diarylethene contains part of a monocyclic or polycyclic structure with one or more donor atoms or heteroatoms coordinated to a coordination unit [M], which contains an acceptor atom, M, expressed by the general formula (I).

where unit B is porphyrin or azaporphyrin, each donor atom X is nitrogen, n is 3, [M] represents a coordination unit containing an acceptor atom M wherein the acceptor atom M is rhenium(II), zinc(II), ruthenium(II), osmium(II), rhodium (III), iridium(III), gold(III), gold(I), silver(I), copper(I), copper(II), platinum(II), palladium(II), iron(II), cobalt(III), chromium(III), cadmium(II), or boron(III), R₁ and R₂ individually represent an alkyl group or an alkoxy group, and R₃ to R₅ individually represent atoms or groups selected from hydrogen atom, halogen atom, hydroxyl group, alkyl group, alkoxy group, alkynyl group, cyano group, nitro group, alkyloxycarbonyl group, alkoxy carbonyl group, perfluoroalkyl group, aryl group, cycloalkyl group, aryloxycarbonyl group, aryloxycarbonyl group, mono- or dialkylaminocarbonyl group, alkylcarbonyloxy group, aryloxycarbonyloxy group, aryl group, alkoxy carbonyl group, and aryloxycarbonyl group.

2. The photochromic compound in accordance with claim 1, wherein unit B is a porphyrin.
3. The photochromic compound in accordance with claim 2, wherein R₁ and R₂ represent methyl groups, and R₃ and R₄ represent hydrogen atoms.
4. The photochromic compound in accordance with claim 2, wherein R₁ and R₄ represent hydrogen atoms.
5. The photochromic compound in accordance with claim 2, wherein R₂ and R₃ represent methyl groups.
6. The photochromic compound in accordance with claim 2, wherein R₂ and R₃ represent bromine atoms.
7. The photochromic compound in accordance with claim 2, wherein M represents zinc(II).

8. The photochromic compound in accordance with claim 2, wherein M represents platinum (II).
