PLATINUM(II) COMPLEXES FOR OLED APPLICATIONS

CROSS-REFERENCE TO RELATED APPLICATION
The subject application claims the benefit of U.S. Provisional Application Serial No. 61/623,339, filed April 12, 2012, which is incorporated herein by reference in its entirety.

TECHNICAL FIELD
The present invention relates to a class platinum(II) complexes, their preparation methods, and their applications in organic light-emitting diodes (OLED).

BACKGROUND
As organic light-emitting diodes (OLEDs) are recognized as the next-generation display and lighting technology, OLED related technologies are rapidly developing. Organic-based emitting material is one of the most important core technologies in OLED; therefore, much effort has been devoted to this area. Since triplet emitters could fully utilize all excitons generated in the device, they are the focus in the field of emissive material development.

The idea of using phosphorescent materials in OLED was independently introduced by Baldo et al., Ma, and Che et al. in 1998. The world’s first phosphorescent OLED (P-OLED) was fabricated using phosphorescent platinum(II) complex [Pt(OEP)] (OEP = octaethylporphin) (Nature 1998, 395, 151–154) and osmium(II) complex [Os(CN)2(PPh3)(X)] (X = 4,4'-diphenyl-2,2'-bipyridine) (Synth. Met. 1998, 94, 245–248) as emitting materials respectively. High efficiency P-OLEDs have continuously been fabricated from new phosphorescent materials and are useful in various mobile electronics devices such as cellphones.

Although the phosphorescent materials that are currently used in the OLED industry have high emissive quantum efficiency (more than 60 %), improved phosphorescent materials are needed. As a result, continuous attempts have been made in the development of new materials, especially blue-emitting materials.

In addition, most P-OLEDs suffer from high roll-off. In the cases of platinum containing materials, more than 90 % roll-off is observed in 1,000 cd/m² (Applied Physics Letter 92, 163305 (2008), Chemical Communications 2005, 1408-1410, Chemical Communications 2004, 1484 – 1485, Applied Physics Letter 91, 063508 (2007), Chemistry A European Journal 2010, 16, 233 – 247). This problem of high efficiency roll-off is due to triplet-triplet annihilation and/or excimer formation. To solve this problem, previous researchers added bulky groups such as tert-butyl groups in the emissive molecules; nevertheless, the P-OLEDs fabricated from these

In one embodiment, the tetradentate ligands with Structure II can be prepared by a series of reactions depicted in Figures 1.

According to Figure 1, Precursor 210 reacts with Precursor 220 or Precursor 230 reacts with Precursor 240, through Reaction 301 to form Precursor 260 or through Reaction 302 to form Precursor 280, depending on the chemical structure of the Precursor 210 – Precursor 240. If Precursor 260 is produced, it is transformed to Precursor 270 through Reaction 305 and then transformed to Precursor 280 through Reaction 306. Finally, Precursor 208 is transformed to a ligand with a chemical structure of Structure II by Reaction 307. Precursor 260 and Precursor 280 can also be produced by reacting Precursor 240 with Precursor 250 through Reaction 303 or Reaction 304. All reactions 301 – 307 can be a single step or multi-step reaction.

In one embodiment, Reaction 301 comprises reacting Precursor 210 and Precursor 220 or Precursor 230 and Precursor 240. In one embodiment, Reaction 301 is performed in the presence of excess ammonium acetate and a solvent under a reflux condition. Suitable solvents for Reaction 301 include, but are not limited to, methanol. In one embodiment, Reaction 305 comprises a palladium coupling reaction using bis[2-(diphenylphosphine)phenyl]ether (DPE-phos) as a ligand, tris(dibenzylideneacetone)dipalladium(0) as the catalyst, potassium tert-butoxide as the base and toluene as the solvent, under an inert nitrogen environment at 80 °C.

In one embodiment, Reaction 306 is the same as Reaction 305.

In one embodiment, Reaction 307 comprises reacting pyridine hydrogen chloride with Precursor 280.

In one embodiment, Reaction 307 comprises reacting carbon tetrafluoride with Precursor 280.
In another embodiment, the present invention provides a method of preparing the organometallic complex with chemical structure of Structure I, comprising reacting a ligand with chemical structure of Structure II with a plaintiff(II) salt in the presence of solvent(s). Other chemicals such as based will be added if they are needed in the reaction. In one embodiment, the platinum(II) salt is potassium tetrachloroplatinate. In another embodiment, the solvents are glacial acetic acid and chloroform.

Industrial Applications of Platinum(II) Based Organometallic Complexes

The platinum(II) based organometallic complexes having the chemical structure of Structure I show strong emission with high solution quantum yield.

As the platinum(II) based organometallic complexes of Structure I have a rigid structure which reduces the non-radioactive decay, the emission quantum efficiency of these complexes are high. Therefore, high efficiency organic light emitting diode (OLED) can be fabricated by using these complexes as emitting material.

In one embodiment, the OLED fabricated using the organometallic complex of Structure I shows a high efficiency of greater than 70 cd/A. In another embodiment, the OLED fabricated using the organometallic complex of Structure I shows a high efficiency of greater than 40 cd/A, including, but not limited to, greater than 45 cd/A, 50 cd/A, 55 cd/A, 60 cd/A, 65 cd/A, 70 cd/A, 75 cd/A, 80 cd/A, or 85 cd/A.

In one embodiment, the organometallic complexes with the chemical structure of Structure I have a X_{15}-N-X_{16}-R_{11} substructure which makes the complexes non-planar; as a result, the self-quenching effect of these complexes are low. In one embodiment, the self-quenching constant for the complexes of Structure I are in the order of 10^7 or lower, including, but not limited to, lower than in the order of 7\times10^6, 5\times10^6, 3\times10^6, 10^6, 7\times10^5, 5\times10^5, 3\times10^5, or 10^5.

The effect of triplet-triplet annihilation in the devices is suppressed. As a result, the efficiency roll-off in the devices fabricated by using these complexes as emitting materials are low.

In one embodiment, the efficiency roll-off of the device at 1000 cd/A is less than 7%. In another embodiment, the efficiency roll-off of the device at 1000 cd/A is less than 20%, or any percentages lower than 20%, including, but not limited to, lower than 17%, 15%, 13%, 10%, 7%, 5%, or 3%.

Furthermore, due to the low self-quenching, higher doping concentration can be used to increase the device efficiency while the CIE can be kept as the excimer emission is avoided, or is substantially avoided.
In one embodiment, a device shows no, or almost no, excimer emission with 10% doping concentration.

As the complexes show emission from green to orange region, green to orange OLED can be fabricated by using the organometallic complex of Structure I as the single emitter. In an embodiment, a blue emitting material (or layer) is added to the orange device, and white OLED can be fabricated.

In one embodiment, the device fabricated using the organometallic complex of Structure I shows green emission with CIE of (0.25 ± 0.05, 0.63 ± 0.05).

In another embodiment, the device fabricated using the organometallic complex of Structure I shows yellow to orange emission with CIE of (0.40 ± 0.1, 0.4 ± 0.1).

Since the organometallic complexes of Structure I do not carry net charge and are soluble in common solvents, various device fabrication methods can be used in OLED fabrication.

The luminescent platinum(II) compounds of the present invention can be formed into thin films by vacuum deposition, spin-coating, inkjet printing or other known fabrication methods. Different multilayer OLEDs have been fabricated using the compounds of the present invention as light-emitting material or as dopant in the emitting layer. In general, the OLEDs consist on an anode and a cathode, between which are the hole transporting layer, light-emitting layer, and electron transporting or injection layer. The present invention makes use of an additional carrier confinement layer to improve the performance of the devices.

In one embodiment, the OLED is fabricated by vacuum deposition.
