Hong Kong domestic health spending: financial years 1989/90 to 2006/07

Abstract

This report presents the latest estimates of Hong Kong domestic health spending for fiscal years 1989/90 to 2006/07, cross-stratified and categorised by financing source, provider, and function.

Total expenditure on health (TEH) was HK\$75 048 million in fiscal year 2006/07, which represents an increase of HK\$4405 million or 6.2% over the preceding year. Represented as a percentage of gross domestic product (GDP), TEH increased from 3.6% in 1989/90 to 5.6% in 2003/04 and then decreased to 5.0% by 2006/07. Taking population growth into account, total health spending per capita (at constant 2007 prices) grew at an average annual rate of 5.1%, which was faster than the average annual growth rate of per capita GDP by 2.1 percentage points.

In 2006/07, government financing of health expenditure was HK\$37 417 million (49.9% of TEH), which was the first time it was surpassed by private spending (HK\$37 631 million) in the last decade as a result of the continued growth of private spending (averaging 9.5% per annum in real terms since 2002/03). The second important source of health financing was out-of-pocket payments by households (35.2%), followed by employer-provided medical benefits (7.4%) and private insurance (5.6%). Private insurance has taken on an increasingly important role for financing private spending, whereas household and employer expenditure together has shown a corresponding decrease during the same period.

Of the HK\$75 048 million total health expenditure in 2006/07, current expenditure comprised HK\$71 888 million (95.8%), whereas HK\$3161 million (4.2%) was for capital expenses (ie investment in medical facilities). Analysed by health care function, services for curative care accounted for the largest share of total health spending (66.2%) which was made up of ambulatory services (35.2%), in-patient curative care (27.1%), day patient hospital services (3.4%), and home care (0.5%). In response to the escalating demand for private health care, private hospitals had increased capital expenditure leading to an observed increase in investment in medical facilities from 2.2% to 4.2% of total spending over the period 2002/03 to 2006/07.

Analysed by health care provider, hospitals accounted for the largest share (42.7%) and providers of ambulatory health care the second largest share (30.9%) of total health expenditure in 2006/07. The downward trend in hospital share after 2002/03 was primarily driven by the reduced public spending on hospitals, albeit with continued growth in corresponding private spending since 1997/98. Meanwhile, expenditure at providers of ambulatory services accounted for an increasing share of health spending after 2003/04, mainly due to increases in the volume and expenditure for private services.

Not taking into account capital expenses (ie investment in medical facilities), public current expenditure on health amounted to HK\$35 437 million (49.3% of total current expenditure) in 2006/07 with the remaining HK\$36 451 million made up of private sources of funds.

Expenditure on hospital care (HK\$32 069 million) was predominately funded by general government revenue (83.8%), whereas that on providers

E-mail: tinyiukei@hku.hk

of ambulatory health care (HK\$23 201 million) was by private household out-of-pocket payments (67.3%). This reflects the mixed health care economy of Hong Kong, where public hospitals generally account for about 90% of total bed-days and private doctors (including western and Chinese medicine practitioners) provide about 70% of the out-patient care.

Although both public and private spending were mostly expended on personal health care services and goods (92.2% of total spending), the distributional patterns among functional categories differed. Public expenditure was targeted at in-patient care (53.3%) and substantially less at out-patient care (24.4%), especially first-contact care. In comparison, private spending was mostly concentrated on out-patient care (48.7%), whereas medical goods outside the patient care setting (22.4%) and in-patient care (18.9%) comprised the majority of the remaining share.

Compared to the Organisation for Economic Co-operation and Development countries, Hong Kong has devoted a relatively low percentage of GDP to health care in the last decade. As a share of total spending, public funding (either general government revenue or social security funds) was also lower than in most comparably developed economies, although commensurate with its public revenue collection base.

Introduction

This article presents the latest estimates of domestic health spending in Hong Kong, following the previous figures published in February 2010.¹ It provides updated estimates of total expenditure on health (TEH) for the financial years 1989/90 to 2006/07 based on the established conceptual framework for Hong Kong Domestic Health Accounts (HKDHA),² originally adopted from the System of Health Accounts.³ We also revised the previous estimates for the years 1989/90 to 2005/06, as more (accurate) data became available, allowing for retrospective comparisons and longer-term secular trend or time-series analysis.

The HKDHA is a set of statistics on health care expenditures, both public and private, in Hong Kong. It provides a detailed and complete picture of health care expenditures and facilitates comparison with other economies that adopt the same framework in calculating their health expenditures. Under HKDHA, health expenditures consist of all expenditures or outlays for medical care, disease prevention, health promotion, rehabilitation, long-term care, community health activities, health administration and regulation, and capital formation with the predominant objective of improving health.

The HKDHA is a product of collaborative effort by many government bureaus/departments, public organisations as well as private institutions. It was compiled from a multitude of information sources. Most public

expenditure data were derived from financial accounts, whereas private expenditure data were largely from survey estimates, and are subject to more uncertainties and reporting/recording errors.

The information contained in this report represents a basis for assessing and understanding trends and levels of health spending in Hong Kong. It enables the public, policy makers, and researchers to assess the performance of the local health system over time, and to evaluate health expenditure-related policies.

Total expenditure on health by financing source

In fiscal year 2006/07, TEH was HK\$75 048 million representing an increase of HK\$4405 million or 6.2% over the preceding year. In real terms, TEH grew at an average annual rate of 6.3% throughout the period, from HK\$27 236 million in 1989/90 to HK\$76 994 million in 2006/07 at constant 2007 prices (Fig 1 & Table 1).

In comparison, real GDP grew at a lower average annual rate of 3.6% prior to 2003/04 but a higher rate of 7.3% between 2003/04 and 2006/07. Consequently, total health spending as a percentage of GDP increased from 3.6% in 1989/90 to 5.6% in 2003/04 and then decreased to 5.0% by 2006/07 (Table 1).

During the period, per capita TEH grew from HK\$4790 to HK\$11 228 at constant 2007 prices, faster than per capita GDP by 2.1 percentage points per annum on average (5.1% vs 3.1%) [Fig 2 & Table 2].

In 2006/07, government financing of health expenditure was HK\$37 417 million, which was the first time it was surpassed by private spending (HK\$37 631 million) in the last decade. This is the result of downward adjustment of Hospital Authority expense (and hence subvention) following 2003/04, coupled with the expansion of the private market as evident from the substantial growth of private health spending at a real rate of 9.5% per annum on average since 2002/03 (Fig 3 & Table 3). Throughout the period 1989/90 to 2006/07, public expenditure grew 7.8% per annum on average (from HK\$10 736 million to HK\$38 387 million at constant 2007 prices), compared with a corresponding increase of 5.1% (from HK\$16 501 million to HK\$38 607 million) for private expenditure, resulting in a growing share of public spending from 39.4% in 1989/90 to 57.6% in 2003/04, albeit a notable decrease to 49.9% in 2006/07 (Table 3).

As shown in Table 4, public spending was the major source of health financing since the establishment of the Hospital Authority in 1991, whereas private household out-of-pocket expenditure accounted for the second largest but decreasing share of TEH (from 42.7% in 1991/92 to 29.5% in 2003/04 with rebound after that to 35.2% in 2006/07). The next important source of health financing was

employer-provided group medical benefits (7.4-10.6%), followed by private insurance (1.2-5.6%) and other private sources of funding (0.8-1.9%). Private insurance has played an increasingly important role in financing private spending (from 2.2% of total private spending in 1989/90 to 11.2% in 2006/07), whereas household and employer expenditure together have shown a corresponding decrease from 94.7% of total private spending in 1989/90 to 85.1% in 2006/07 (Fig 4 & Table 4).

Total expenditure on health by function

Of the HK\$75 048 million TEH in 2006/07, HK\$71 888 million (95.8%) was current expenditure, whereas HK\$3161 million (4.2%) was capital expenditure (investment in medical facilities). Services for curative care accounted for the largest share (66.2%), which was made up of ambulatory services (35.2%), in-patient curative care (27.1%), day patient hospital services (3.4%) and home care (0.5%). The second largest share was for medical goods outside the patient care setting (11.2%). The remaining current expenditure was distributed between long-term care (4.9%), health programme administration and health insurance (3.8%), rehabilitative and extended care (3.7%), prevention and public health services (3.7%), and ancillary services to health care (2.3%) [Fig 5 & Table 5].

As a share of TEH, expenditure on in-patient curative care increased from 1989/90 to 2002/03 (from 20.6% to 27.8%) and slightly decreased afterwards to 27.1% in 2006/07, which reflects the spending pattern of the Hospital Authority. In comparison, expenditure on ambulatory services diminished from 42.4% in 1989/90 to 34.7% in 2003/04 and stayed around 35.5% thereafter. In response to the escalating demand for private health care, private hospitals had increased capital expenditure leading to an increase in investment in medical facilities from 2.2% to 4.2% over the period 2002/03 to 2006/07 (Table 5).

Other health-related functions, which do not fall under the formal definition of TEH, accounted for 5.3 to 8.8% of total health and health-related expenditure. Of these, during the period 1989/90 to 2006/07 research and development in health, and environmental health grew 1.1 and 1.3 percentage points respectively, whereas education and training of health personnel shrank 0.7 percentage point (Table 5).

Total expenditure on health by provider

In 1989/90, the largest share of TEH was spent on providers of ambulatory health care (44.7%), followed by hospitals (28.0%). As a result of a gradual reduction in spending on ambulatory services and a corresponding increase in the number, service spectrum, and quality of hospitals during the period, by 1996/97 the situation had reversed, with the share of hospitals (39.1%) surpassing that of providers of ambulatory health care (38.0%). In 2006/07, hospitals

(42.7%) accounted for the largest share, followed by providers of ambulatory health care (30.9%). This service consolidation at institutions (as opposed to free-standing ambulatory clinics, most of which are staffed by solo providers) was similar across both the public and private sectors (Fig 6 & Table 6).

The downward trend in hospital share after 2002/03 was primarily driven by reduced public spending on hospitals, although there was continued growth in corresponding private spending since 1997/98. Meanwhile, expenditure at providers of ambulatory services accounted for an increasing share of health spending after 2003/04, mainly due to increases in volume and expenditure for private services.

Relative to TEH, expenditure on nursing and residential care facilities (which mainly provide long-term nursing care) doubled from 1.8% to 3.6% during the period 1989/90 to 2006/07, whereas expenditure at retail sale and other providers of medical goods decreased slightly by 0.6 percentage point. Spending on other providers including provision and administration of public health programmes, and general health administration and insurance constituted relatively stable and less significant shares over that period.

Current expenditure on health by function and provider

Tables 7 and 8 show the current expenditure on health by function and provider in 2006/07, without taking into account capital expenses (ie investment in medical facilities).

Most of the total current expenditure was expended on out-patient care (HK\$26 382 million or 36.7%) which was provided by providers of ambulatory health care and hospitals in the ratio of 67.6% to 31.5%. Among providers of ambulatory care, offices of medical practitioners accounted for the largest share of expenditure on out-patient care (54.1%), followed by offices of dentists (9.3%) and offices of other health practitioners and out-patient care centres (4.2%).

The next largest share of total current expenditure was for in-patient care (HK\$25 785 million or 35.9%). Hospitals (82.7%) accounted for most of this expenditure, followed by nursing and residential care facilities (8.2%), providers of ambulatory health care (8.9%), and providers in the rest of the world (0.2%).

Of the HK\$3104 million spent on day care (4.3% of total current expenditure), 78.7% was allocated to hospitals, 17.4% to nursing and residential care facilities and 3.8% to providers of ambulatory health care. Expenditure on ancillary services to health care was HK\$1763 million (2.5% of total current expenditure), of which 34.8% was paid to laboratories and diagnostic imaging facilities and

65.2% to all other providers of ambulatory health care.

In 2006/07, HK\$840 million (1.2% of total current expenditure) was spent on home care. Almost all of this expenditure was incurred at providers of ambulatory health care (91.0%), with only 9.0% at nursing and residential care facilities.

Nearly 45% of total current expenditure was paid to hospitals (HK\$32 069 million). The hospital expenditure by health care function was distributed to in-patient care (66.5%), out-patient care (25.9%), and day care (7.6%).

The next largest share of current expenditure was spent on providers of ambulatory health care (HK\$23 201 million), of which 76.9% was for out-patient care, 9.9% for in-patient care, 7.6% for ancillary services to health care, and the remaining 5.6% for home care, day-care, medical goods outside the patient care setting, and prevention and public health services.

Current expenditure on health by provider and financing source

Tables 9 and 10 show the current expenditure on health by provider and financing source in 2006/07.

Spending structure of the financing sources

Public current expenditure on health amounted to HK\$35 437 million (49.3% of total current expenditure) which was mostly incurred at hospitals (75.9%), whereas private current expenditure (HK\$36 451 million or 50.7% of total current expenditure) was mostly incurred at providers of ambulatory health care (53.9%). This reflects the mixed health care economy of Hong Kong, where public hospitals generally account for about 90% of total bed-days (or 80% of admissions) and private doctors provide about 70% of out-patient care.

Other major providers financed by public current expenditure included providers of ambulatory health care (10.0%), provision and administration of public health programmes (6.7%) and nursing and residential care facilities (5.9%). Apart from paying for providers of ambulatory care, private spending funded goods and services provided by retail sales and other providers of medical goods (22.2%), hospitals (14.2%) and general health administration and insurance (6.9%).

Employer-provided group medical benefits channelled 52.6% and 35.3% of their funds through providers of ambulatory health care and hospitals, respectively, whereas private insurance channelled 25.9% and 30.9%, respectively. Private household out-of-pocket payments funded a wide range of providers, the largest share being paid to providers of ambulatory health care (59.0%), the second to retail sales and other providers of medical goods (30.2%), and the third to hospitals (7.2%), mostly for private care but a small share

went to public hospitals as co-payments.

How different providers are financed

Of the HK\$32 069 million spent on hospital care, 83.8% came from general government revenue, 6.1% from employer-provided group medical benefits, 5.9% from private household out-of-pocket payments, and 4.1% from private insurance.

The next largest share of current expenditure was used to finance providers of ambulatory health care (HK\$23 201 million or 32.3%), followed by retail sales and other providers of medical goods (HK\$8358 million or 11.6%). The former had a mix of financing sources which included private household out-of-pocket payments (67.3%), general government revenue (15.2%), employer-provided group medical benefits (12.6%), private insurance (4.7%), and non-profit organisations and other private sources (0.2%). By contrast the latter was predominately paid by households (95.5%) and substantially less by the government (3.1%) and non-profit organisations (1.4%).

Similarly, across nursing and residential care facilities and provision and administration of public health programmes, most expenditure was publicly financed.

Current expenditure on health by function and financing source

Tables 11 to 13 show the current expenditure on health by function and financing source in 2006/07.

Functional structure of spending by financing source

Although both public and private spending were mostly expended on personal health care services and goods (92.2%), the distributional patterns among functional categories differed. Public expenditure was targeted at in-patient care (53.3%) and out-patient care (24.4%). The rest of public funding was distributed to day care (7.7%), prevention and public health services (7.3%), and ancillary services to health care (3.6%).

In comparison, private spending was mostly concentrated on out-patient care (48.7%), medical goods outside the patient care setting (22.4%), and in-patient care (18.9%). Private household out-of-pocket payments were expended on various functions. The largest share was for out-patient care (54.1%), the second for medical goods outside the patient care setting (30.5%), followed by in-patient care (12.5%). Private insurance funded in-patient care (30.9%), followed by out-patient care (23.2%), and ancillary services to health care (2.7%).

How the different functions are financed

General government revenue funded 73.3% of expenditure on in-patient care. The remainder was from household out-of-pocket payments (12.9%), employer-provided group

medical benefits (8.7%), private insurance (5.0%), and other private funds (0.1%). Funding for out-patient care was more even: 54.2% from private household out-of-pocket payments, 32.8% from the government, 9.2% from employer-provided group medical benefits, and 3.7% from private insurance.

Similarly, across home care and prevention and public health services, almost 95% of the funding of each function was from the government and the rest was from private household out-of-pocket payments (5.3% and 6.1%) and other private funds (<1%). Day care services were also mainly financed by the government (87.7%), and the remainder from private household out-of-pocket payments (12.1%) and other private funds (0.2%). Ancillary services were funded by the government (71.6%), employer-provided group medical benefits (13.5%), private household out-of-pocket payments (8.2%), private insurance (6.5%), and other private funds (0.2%).

Medical goods outside the patient care setting were predominately funded by private household out-of-pocket payments (95.6%); only 3.1% was from general government revenue. As pharmaceuticals and other medical consumables made up more than 75% of medical goods outside the patient care setting, the distribution of funds was similar (95.3% from private household out-of-pocket payments and 3.4% from the government).

When stratified by public versus private providers, public care was largely funded by government revenue (about and mostly above 90% for individual functions and 95.0% overall). The subsidy levels of in-patient and out-patient care, which consumed nearly 80% of government funds at public facilities, were 97.0% and 89.4%, respectively; the remainder was paid out-of-pocket by households. In contrast, households, employers, and insurers were the major payers in the private market, making up 93.8% of total expenditure. As for private in-patient care (including long-term care provided in nursing homes), 80.6% of expenditure was funded through household out-of-pocket payments (35.3%), employer-provided group medical benefits (28.4%), private insurance (16.5%), and other private sources (0.4%), whereas the government paid for 19.4%. Out-patient care was funded almost exclusively (99.7%) by private sources, namely households (79.2%), employers (14.4%), insurers (5.8%), and others (0.2%).

International comparisons

Comparisons of TEH was made between Hong Kong and member countries of the Organisation for Economic Co-operation and Development (OECD) using the health statistical database, compiled and maintained by the OECD Secretariat and released in October 2010.⁴ Nonetheless, such comparison cannot show whether a particular level of expenditure is appropriate. Instead, comparisons are useful in pointing out certain general patterns in spending.

Hence, we should be mindful that comparisons of health expenditures and source of financing between countries or regions reflect each economy's own specific circumstances, societal values, and solutions.

Table 14 provides the TEH as a percentage of GDP for selected OECD countries and Hong Kong in 1996, 2001 and 2006. In the last decade, TEH in Hong Kong was low as a percentage of GDP compared with OECD countries. Nonetheless, Hong Kong health care system achieved service quality and health outcome that fared well by global standards, at relatively low TEH as a percentage of GDP, indicating cost efficiency and effectiveness. Besides, Hong Kong public health expenditure should be considered in conjunction with its low tax regime and stringent control on government expenditure. When scaled by the public revenue base, Hong Kong public spending on health fell very close to the regression line (Fig 7).

On the other hand, private household out-of-pocket expenditure and private insurance (or sum of employer-provided group medical benefits and individually purchased private insurance) accounted for a large share of total health spending in comparison with OECD countries (Table 15).

Major differences between Hong Kong Domestic Health Accounts and General Revenue Account

Notably, public health expenditure under HKDHA covers a wider scope than government expenditure under the health policy area in the General Revenue Account (GRA), and is therefore often higher than the latter.

Under the GRA of the government budget, only direct expenditure by the Food and Health Bureau and the Department of Health (including the Bureau's allocation to the Hospital Authority), and expenditure directly related to health by departments (such as the Government Laboratory) are counted as government expenditure under the health policy area.

Under the HKDHA framework, apart from those classified as health expenditure under the GRA, public health expenditures also cover other health-related functions performed by other government departments. For example, the HKDHA include health expenditure on nursing homes, rehabilitation, and medical social services under the Social Welfare Department, and ambulance service under the Fire Services Department and Auxiliary Medical Service, etc. These are not included in the government expenditure under the health policy area in the GRA.

The HKDHA is more comprehensive than the GRA in terms of documentation of public health expenditure. As a result of the above difference, the HKDHA estimates on public health expenditure are essentially higher than the corresponding GRA estimates. The difference amounted to 14% to 17% in 2001/02 to 2006/07. Table 16 is a comparison of the estimated public health expenditures under HKDHA

and GRA.
