Foreword

In 1998, the Faculty of Medicine at The University of Hong Kong, Hong Kong SAR established a Clinical Trials Centre to act as an interface between the industry and investigator teams at the university and affiliated hospitals. Trial activities have since focused on evaluating new clinical treatments, procedures, devices and diagnostic tools -- commonly developed by large international pharmaceutical companies from North America, Europe and Japan. Reasons for involvement in such research are both academic and financial, in addition to the possibility of improving the care of trial participants.

Most clinical trials of new treatments are of the highest quality; with a good study design, sufficient number of trial participants and sufficient resources to conduct essential investigations and laboratory tests. Since trials aim to provide evidence for both treatment efficacy and treatment safety of new medical treatments, the results are of interest not only locally, but also to clinical researchers and clinicians world-wide. Since the likelihood is high of having results published in international clinical research journals of high repute, the trial results can therefore have a high impact on the global medical scientific community. For this reason, clinical trials on new medical treatments generally have a high academic value, or what we usually call HIGH IMPACT RESEARCH.

A pharmaceutical or biotechnology company usually funds all parts of a clinical trial -- including drug cost, clinical investigations, laboratory tests processing, investigator and nursing fees, data management, statistical analysis and medical writing. Since the trial results are commonly reviewed by drug regulatory authorities in the US, Europe or Japan, trial costs affecting the quality of the data collected cannot be cut, or acceptance would be jeopardised. Clinical trials not only embrace patient treatment costs, but also provide investigator teams with extra funding for staff employment. In an academic medical institution, the investigator trial fee provided by the sponsor for the work conducted by the clinical research team is commonly used to enhance other research activities that are not easily funded by other means. One important by-product of trial involvement is thus that the investigator team may be able to produce additional, independent research. More funding leads to more research, which leads to an increasing number of studies published in international publications -- and ultimately HIGHER IMPACT and greater prestige for the team and its institution.

The question posed by this book is simple – how HIGH IMPACT is CLINICAL RESEARCH in HONG KONG in comparison with other predominantly Chinese communities like China, Taiwan and Singapore, and to some extent also with the rest of the world? The Clinical Trials Centre at HKU is keen to attract more clinical trials to Hong Kong – an initiative which both encourages the biotechnology industry in Hong Kong and establishes Hong Kong as a bridge to biotechnology development in mainland China. The ambition is also to attract more research and development teams from the international pharmaceutical industry to Hong Kong.

Johan Karlberg, MD, PhD Professor and Director Clinical Trials Centre Faculty of Medicine The University of Hong Kong

February 2003

Introduction

Several emerging regions in Asia, Eastern Europe, Africa, and South and Latin America are conducting clinical trials on new drugs, devices and diagnostic tools. This study does not attempt to present a 'big picture' addressing the possibilities or problems concerning the conduct of clinical trials across these regions. Instead, it focuses on a single location in one region -- Hong Kong in Asia. The question being addressed is: What is needed in an emerging region to strive for excellence in order to become a competitive location for the conduct of biotechnology research, when compared with established regions, in say North America, the European Commission and Japan? Many interacting factors are important when striving for excellence. In biotechnology, these not only include the need for long-term financial support from governments and the industry. Also critical is the establishment of an infrastructure that makes the region attractive to large international pharmaceutical companies and researchers of a high international standard. The required infrastructure ranges from access to office space and well-trained local researchers and research support staff to implementing and complying with international guidelines.

Involvement in global clinical trials is certainly a first important step to becoming a player in the biotechnology arena. But that is not enough if the aim is to establish a self-financed local biotechnology industry. The way is long and the investment is large from early discovery of a molecule in the laboratory of a pre-clinical research through clinical trials to the market. But many well-known international pharmaceutical companies were established on the strength of university researchers making important new medical discoveries. With the backing of investors, they were able to develop their molecule into a new medical therapy -- to the benefit of patients and society at large. This has happened many times in North America, Europe, Japan and other developed regions -- and it can be emulated in new emerging biotechnology regions as well.

Before 1996, very few Phase I-III trials for global registration purposes were conducted in Asia outside of Japan. It was hard to name a single local research and development team of an international pharmaceutical company represented in the region. But since then Hong Kong, along with other countries in Asia, has suddenly become an important hub for global clinical trials. Consider, for instance, the quantum leap in clinical trial certificates for phase I-III clinical trials that have been approved by Hong Kong's Department of Health. Between 1988 and 1995, the annual number of certificates approved was 22. This number increased to 56 between 1996 and 1999 -- and to 113 between 2000 and 2001. There were five times more clinical trials of new pharmaceutical entities initiated in 2001 than over the previous five years – and the pace of growth was 500% over 10 years, or 50% per year. Growth in clinical trial activities will certainly continue for decades. How do we know this trend will continue in Hong Kong and in Asia? Well, firstly, it's a global trend – more compounds need to be

developed, so more trials per compound need to be conducted, so more patients will be required for each clinical trial. Secondly, Asia has a large patient population and many potential investigators, which are two important selection criteria for a trial site. Thirdly, some diseases are much more prevalent in Asia than in other continents. Fourthly, the potential market for a new treatment can be large in Asia. Finally, the Asian biotechnology industry is developing very rapidly and also needs to conduct its own trials.

However, some important factors will eventually lead to a negative impact on the expected increase in clinical trial activities and biotechnology development in Hong Kong and Asia if they are not addressed effectively and in a timely manner. Governments, including the Hong Kong SAR Government, must listen, understand and take initiatives to meet the needs of the industry. With the anticipated increase in trial activities will be a growing requirement for well-qualified study site personnel and well-trained personnel working locally for international pharmaceutical companies. It is also important to understand and establish various quality assurance programmes, including international accreditation(s) of clinical laboratory tests, standardisation and audits of the operation of ethics committees, the acceptance and enforcement of international clinical trial guidelines, and the operation of other clinical trial support services.

But who should take the lead to start the transition towards a clinical trial environment up to acceptable international standards? Government institutions, private entities, or both? It is the author's view that this will only happen if there is sufficient 'critical mass' involved -- in both pre-clinical and as well as clinical phases of drug development. In addition, a drug regulatory authority is essential in the region, to advise the industry during various drug development phases and ensure recognition of study results by drug regulatory authorities oversees. If a new drug is not accepted overseas, it cannot be marketed overseas.

The Hospital Authority of the Hong Kong SAR Government is responsible for patient care of most citizens in Hong Kong. The Authority has been very successful in its work, as implied by one of the world's lowest infant mortality rates (about 3 in 1000) and highest life expectancy (about 80 years). A high standard of medical care is, of course, an important aspect when a new therapy enters the clinical testing phase. Hong Kong has two universities with medical faculties – The University of Hong Kong and the Chinese University of Hong Kong – and six other universities.

By outlining academic output over the past 12 years (1990-2001) in the medical and biology, or life science area by various institutions in Hong Kong, this report aims to identify strengths as well as weaknesses from a

pre-clinical and clinical research point of view. Since interest is growing in understanding the differences between ethnic groups in response to medical treatments and safety are becoming more and more interesting, it is also important to compare Hong Kong research with output from three other regions with predominantly Chinese populations – namely China, Singapore and Taiwan. Some comparison with other countries in Asia, as well as countries in other continents, is also relevant as a measure of international recognition and competence.

Research Output and Research Impact

There is no universally accepted and adopted way to describe academic research output, despite demand for such a generally accepted instrument, even at the level of deciding appropriate resource allocation to universities or individual university departments, or for staff promotion purposes. The number of publications is a simple way of measuring academic output. But from a scientific point of view, not all publications carry the same weight or make the same impact. A research report reviewed and accepted by a scientific journal - peer reviewed - is commonly seen as having a higher scientific value than a 'non-peer reviewed' published research report. However, one peer-reviewed journal may have a higher impact factor – i.e. a larger number of citations for each individual paper published in the journal – than another peer-reviewed journal. A further complicating factor is that only a few papers represent most citations in any journal, so a study is not necessarily important even if it is published in a journal with a high impact factor. Comparing the impact factors of journals is meaningless, for instance, if they serve different disciplines in which widely different citation practices may prevail. However, for better or worse, the global trend is for academic publication citation statistics to be increasingly used as a standard metric to assess the quality of scientific work. Both the citation statistics of an individual paper and the 'impact factor' of the journal publishing it is being taken more and more seriously.

This study presents a general comparison of the academic output in life science from January 1990 to November 2001 between Hong Kong institutions, and between Hong Kong and other regions. The results are not presented for funding purposes, staff promotion or for comparison of individual departments. The aim is rather to identify the strengths and weaknesses of clinical research in Hong Kong as an emerging centre for biotechnology development. For this reason, a rather simple method is adopted -- based partly on some common assumptions and practices.

• Database: Publications published in peer-reviewed journals are usually seen as having high impact compared to other types of scientific communication, such as abstracts from meetings, book chapters and departmental reports. This is why only publications listed in the Medline data-base are included.

• Years: The Medline data-base lists publications over the last four decades. But this analysis is restricted to the last 12 years: between January 1990 and November 2001.

• Full-publications: Only full publications (original or review articles, not letters) are included.

• **Corresponding Address:** The corresponding address in the address field of the Medline data-base was used to identify the country and institution of each individual publication. This address virtually always represents the institution that contributed to the majority of research behind the publication, i.e. hypotheses generation, study design, study conduct, funding, data management, medical statistics and medical writing.

• **Citation Report:** Publications included in local scientific journals can be listed in the Medline data-base, but they may not be included in the Journal Citation Reports (JCR) data-base, if they have a low overall impact on the international community. Only publications found both in the Medline data-base and listed in the 2000 version of the JCR data-base were included for most comparisons

• Adjusted Impact Factor: Some areas of research have an average a much lower Impact Factor than other areas, due to a tradition or custom of including either few or many citations in individual publications. All journals in a specific area of the (JCR) data-base are rated in terms of their Impact Factor in relation to each other, rather than in relation to all journals for all areas taken together. This provides an Area Specific or Subject Category Impact Factor; in other words, an Adjusted Impact Factor as illustrates on page 22 – "Impact Factor by Area".

• Very High Impact Factor: The number of publications found in a few general medical scientific journals of very high impact and high repute are also presented in isolation. Four journals were deemed to represent High Impact Clinical Science – The Lancet, New England Journal of Medicine (N Engl J Med), Journal of the American Medical Association (JAMA) and British Medical Journal (BMJ). Two additional journals were chosen to represent High Impact Basic Science: Nature and Science.

• **Population Statistics:** The population size, infant mortality rate and life expectancy of some countries are used in some analyses, from figures published elsewhere.

Global Research Impact given by the Number of Publications

A simple and easy measure of the research impact of a country is the total number of publications. Figure 1 gives the number of full publications – excluding letters as the mode of communication – in Medline between January 1990 and November 2001 for the top 50 countries globally. Disregarding population density, it is not surprising that the United States has the largest number, followed by Japan and United Kingdom. The figures in Figure 1 should be regarded with some caution since about 25% of all full publications in Medline during the years of observation could not be linked to any particular country. Some publications do not give the country in the address of correspondence field; others used local languages such as Italian, German or Swedish to identify the country. Two countries, namely the US and UK, were often identified by individual states or institutions. Despite of this relatively high drop-out rate, the overall picture is nevertheless deemed realistic since the drop-out rate can be assumed to be quite similar between countries. When all the countries previously belonging to "western" Europe were combined, the number of publications increased to 1.22 million -- similar to the US tally of 1.29 million. Note, that 18th position is taken by Taiwan, 24th by China, 31st by Hong Kong and 35th by Singapore when the total number of publications are taken as the measure for comparison. About 62,000 publications were identified from the four predominantly Chinese communities combined over the 12 years of study.

The overall aim of medical research is to find new treatments or preventive measures for proper management of disease in the community. It is thus be appropriate to incorporate publication density measure as an index of research activity in a population -- such as the number of publications per million people in a population. Figure 1 includes this index, along with the top 50 countries ranked in this way. The top five countries are: Sweden, Israel, Finland, Denmark and Switzerland. Singapore, Hong Kong and Taiwan are 21st, 23rd and 25th, respectively. China, understandably given its huge population, is not among the top 50 countries based on the population density publication index.

Virtually all countries with a sizeable biotechnology industry rank among the top 20 countries in both listings in Figure 1. Countries rated between places 21 and 30 on the population adjusted listing in Figure 1 may be considered representative of emerging countries with the 'know how' to develop competitive international biotechnological industries in the next few decades.

Global 1990 to 2001

Number of full papers in Medline Top 50 countries

Number of publications 1990-2001

Figure 1. The number of publications in Medline between January,1990 and November, 2001 for the top 50 countries globally; the total number of publications (left) and the total number of publications per million population (right).

Research Output and Public Health

The number of publications in medical and biology fields should be of importance for the health care of a population, since a highly active academic staff certainly enhances both the teaching quality of medical professionals and the health of the population at large. Figure 2A shows the association between infant mortality rate (the number of deaths during the first year of life per 1,000 live births) and the number of publications per million populations. There is no association between infant mortality rate and among the countries with a low publication density, but there is a significant (non-linear regression, p<0.01) trend from a value of 20 publications per million inhabitants. A similar significant (p<0.05) pattern can be noted for life expectancy in relation to the publication density number (Figure 2B). Clearly, there is an association between vital health statistics and the number of publications in life science. Consequently, it can be argued that scientific publications in life science not only have an impact on the international academic community, but also on the health of local populations where research is conducted.

Figure 2. The number of publications in Medline per million population between January 1990 and November 2001 for 153 countries all having a population above 0.5 million inhabitants and at least two publications per million inhabitants, plotted in relation to (A) infant mortality rate (number of deaths during the first year of life of 1000 live births) and (B) life expectancy in years, respectively. A logarithmic scale with the base of 10 has been used for the publication rate and the infant mortality rate for an improved visual display of the data.

Asian Research Impact given by the Number of Publications

Figure 3 shows the number of Medline publications for Asian countries, ranked by total number of publications and number of publications per million population. In Asia, there are about 10 countries with a significant academic output in life science. Based on the population-adjusted publication tally, Israel is on top followed by Japan, Singapore, Hong Kong and Taiwan. However, based on total publications, a few other countries emerge among Asia's top 10 countries, namely India, South Korea, China, Turkey and Thailand. There is thus a significant difference in academic activity among the 53 Asian countries, with very low activity for the majority.

Figure 3. The number of publications in Medline between January 1990 and November 2001 for all Asian countries (n=53); the total number of publications (left) and the total number of publications per million population (right).

Research Impact given by the Number of Very High Impact Publications

Instead of counting the number of full publications found in Medline, the level of high impact medical research can identified by the number of studies published in those few journals with both a very high impact factor and a wide readership. In this presentation, four such journals – The Lancet, New England Journal of Medicine (N Engl J Med), Journal of the American Medical Association (JAMA) and the British Medical Journal (BMJ) – were selected to represent the most important and prestigious publications in Clinical Science. Two other journals – Nature and Science – were chosen to represent Pre-clinical Science. Arguably, other journals of very high impact might have been considered as well, so readers should draw their own conclusions from the following results.

Table 1 provides the number of publications between 1990 and 2001 in the six selected journals with a very high impact having an address of the corresponding author in China, Hong Kong, Singapore or Taiwan. For comparison, the corresponding figures for the five countries with the highest number of Medline publications per million populations as shown in Figure 1 are provided in Table 1 as well. Among the latter group of countries Sweden has the highest number of publications (n=321) in the very high impact Clinical Science area, while Denmark proportionately has the highest number (0.90%) of Medline publications of very high impact Clinical Science papers. In the Pre-clinical Science area, Switzerland has a significantly higher number of publications (n=331) than any of the others giving comparable high proportion (0.61%) of such important publications in relation to the total number of Medline publications from Switzerland.

Figure 4 and Table 1 show the corresponding numbers for the four predominantly Chinese communities. Hong Kong accounts for 55% of all publications in the four very high impact factor Clinical Science journals, while China accounts for 55% of the very high impact Pre-clinical Science publications. In proportion to the number of Medline publications, Hong Kong and China are comparable with the "top" five countries with 0.58% in Clinical Science (Table 1). In this comparison, neither Singapore nor Taiwan emerge in a favourable position. Since Hong Kong is part of China – 'one country, two systems' – the two combined are arguably perfectly matched, with one strong in Clinical Science and the other in Pre-clinical Science.

Table 1. The number of publications between 1990 and 2001 in some selected general journals with a very high impact representing Clinical and Pre-clinical Science with the corresponding address of the author in China, Hong Kong, Singapore or Taiwan. For comparison, the corresponding figures for the five countries with the highest number of Medline publications per million population (Figure 1) are included as well.

Very High Impact Research Output

Number of full papers in six major journals by country

12 year period - 1990 to 2001

China Hong Kong Singapore Taiwan

Figure 4. Very High Impact research output in China, Hong Kong, Singapore and Taiwan. Very High Clinical Science impact is here represented by the number of publications between 1990 and 2001 in four major general journals, i.e. The Lancet, New England Journal of Medicine (N Engl J Med), Journal of the American Medical Association (JAMA) and the British Medical Journal (BMJ). High Pre-clinical Science impact is here represented by the number of publications, i.e. Science and Nature.

Table 2 provides similar figures for the various parties in Hong Kong. Most (63/65) of the very high impact Clinical Science publications are from the two Medical University Faculties, with a similar contribution. The very few (n=6) Hong Kong publications in Pre-clinical Science published in Nature or Science are from The University of Hong Kong (n=2) and other Academic Institutions in Hong Kong (n=4), but none from the Chinese University of Hong Kong.

From these results, it can be concluded that Hong Kong holds a strong position in Clinical Science in relation to the other three predominantly Chinese communities, as well as in relation to the globally top five countries, while very high impact in Pre-clinical Science falls short in Hong Kong.

Table 2. The number of publications in some selected general journals with a very high impact representing Clinical Science and Pre-clinical Science with the corresponding address of the author in Hong Kong; the Chinese University of Hong Kong (CUHK), The University of Hong Kong (HKU), other Hong Kong Universities (Academia) and other institutions including Government and private hospitals (Other).

Citation Index

The Journal Citation Reports is an essential and comprehensive resource for journal evaluation, using citation data drawn from over 8,400 journals worldwide. Coverage is both multidisciplinary and international, and incorporates journals from over 3,000 publishers in 60 nations. The JCR is the only source of citation data on journals, and includes virtually all specialties in the areas of science, technology and the social sciences. JCR Web shows the relationship between citing and cited journals in a clear, easy-to-use framework. JCR Web is available annually in two editions: a) the Science Edition contains data from roughly 5,000 science and technology journals; b) the Social Sciences Edition contains data from roughly 1,500 social sciences journals.

This analysis is based on the Science Edition year 2000 version and no part of the Social Sciences Edition.

Impact Factor

The journal impact factor is a measure of the frequency with which the average article in a journal has been cited in a particular year. The impact factor is calculated by dividing the number of current citations to articles published in the two previous years by the total number of articles published in the two previous years.

Impact Factor by Area

The Science Edition of the Journal Citation Reports of year 2000 includes 169 different areas, as listed in Table 3. The areas are given in alphabetical order. The median impact factor (IF) is given for each area, computed over all the individual journals listed in a certain area. The number of journals listed under each area is also provided in Table 3. Some journals are included in more than one area. Note that many of the clinical areas such as Anesthesiology, Cardiac and Cardiovascular Systems, Clinical Neurology, General and Internal Medicine, Obstetrics and Gynecology, Orthopedics, Pediatrics and Surgery have a median IF of 0.6 to 1.1. A higher median IF (1.5 to 2.0) can be seen in other areas such as Endocrinology and Metabolism, Gastroenterology and Hepatology, Hematology, Immunology, Infectious Diseases, Neurosciences and Oncology. Obviously, the practice of citation is different in the various areas -- making if virtually impossible to compare a journal's IF belonging to one area with the IF of a journal belonging to another area.

Table 3. The listing includes all areas (n=169) of the year 2000 Science Edition of the Journal Citation Reports. The median impact factor (IF) of the area specific journals and the number of journals (N) are given for each area. Note that a journal can be included in more than one area.

Surgery as an Example of Area Adjusted Journal Impact Factor

As an illustration, one single area, Surgery, was selected to illustrate the variation in IF among journals listed under one and the same area. Table 4 includes all journals in Surgery with an IF information in the Science Edition of year 2000 Journal Citation Reports. The journals are listed according to the IF and are all ranked (%) in relation to their position in the Surgery research area. The IF figures range from 0.059 to 5.987. This analysis simply codes each journal in three Impact Factor (IF) Codes: A, B and C. All A IF code represents the top 1/3 journals in relation to their IF within the area the journal is listed. This means that all journals with a ranking between 100.0% and 66.7% are given an IF code A. An IF code B is consequently given for journals ranking between 66.6% and 33.3%, and an IF code C to the lowest 1/3 ranked journals, i.e. area adjusted journal impact factor. The same procedure was used in the following description of all 168 areas, as listed in Table 3.

In the following figures we have divided the bars representing the number of publications into three groups; i.e. High Impact (IF code A), Good Impact (IF code B) and Low Impact (IF code C).

Table 4. All journals in Surgery listed in the Science Edition of year 2000 Journal Citation Reports. The journals are listed according to the Impact Factor (IF) and ranked (%) in relation to their position in the Surgery research area. The top 1/3 ranked journals - 100% to 66.7% - are given an 'A' Impact Code, the mid 1/3 ranked journals - 66.6% to 33.3% - are given a 'B' Impact Code and the low 1/3 ranked journals - 66.6% to 33.3% - are given a 'C' Impact Code. The medium Impact Factor in the Surgery research area is 0.81.

Medline Listed Journals with No Impact Factor

There are a few journals included in Medline that have no IF information given in the Science Edition of Journal Citation Reports. Many of these journals have entered the Medline data-base in recent years, thus not providing enough current information to be counted in terms of the IF evaluation. Other journals have been listed in Medline for a longer period, but for various reasons have not been given an IF. Table 5 lists some journals found in Medline but not included in the Science Edition of Journal Citation Reports in year 2000. The publications identified here had corresponding addresses in China, Hong Kong, Singapore or Taiwan and were published from January 1990 to November 2001. As noted from the listing in Table 5, almost all journals are local, i.e. published in one of the four predominantly Chinese regions.

Such local journals have little or no impact on the scientific community from a global perspective. Perhaps publications accepted in local journals did not initially stand up to international standards. It seems thus reasonable to omit the non-IF journals and related publications when describing research output between regions and institutions. The following only counts Medline publications published in journals with an IF ranking.

We have to acknowledge that publications occurring in local journals – being listed or not listed in Medline – counts for a significant position of the life science research output. However, such publications are not easily accessed to the international research community due to that the journal is only available in local libraries and/or that non-English language is used. The standard of the papers published in local journal are commonly not received by an international board of scientist also affecting the quality of the research communication. It may however be important that health information distributed to the local health practitioners in the local language through local journals, but they are commonly based on results already appearing in international journals.

Table 5. Journals included in Medline with no Impact Factor information in the Science Edition of year 2000 Journal Citation Reports. The list includes those journals with 80 identified publications or more with the corresponding address in China, Hong Kong, Singapore or Taiwan during 1990 to 2001.

Figure 5 gives the number of Medline publications for China, Hong Kong, Singapore and Taiwan for the twelve years (1990-2001) and four three-year periods (e.g. 1990-1992, etc.) The lower panel of Figure 5 gives the same numbers but divided by the population of the respective region, in millions. The bars have been divided into four parts, each representing the type of publications from an Area Adjusted Impact Factor point of view, a low IF corresponds to the Impact Factor Code 'C' (Please refer to page 24), a good Impact Factor corresponds to the Impact Factor Code 'B', a High Impact Factor corresponds to the Impact Factor Code 'A'. No Impact Factor means that the journal where the publication was printed is not listed in the Journal Citation Reports for year 2000.

Taiwan

26593

1990-2001

Medline Research Output

Number of full papers in Medline by country

Number of full papers in Medline by country / million population

Figure 5. Number of Medline publications published between 1990 and 2001. The number is given for China, Hong Kong, Singapore and Taiwan for all 12 years together, and for four three-year periods (eg. 1990-1992, etc). The total number of publications is given in the upper panel and per million population in the lower panel. Each bar has been divided into four groups of publications - no impact factor and a low, good or high Area Adjusted IF, as described on page 24.

29

Figure 6 gives the same numbers as Figure 5, with the exception that publications included in journals with no Impact Factor have been omitted for logical reasons as discussed on page 26. Taiwan has the largest number of publications tollowed by China, Hong Kong and Singapore. However, adding the figures for China and Hong Kong results in a number close to that of Taiwan.

The increase in the total number of Medline publications with an Impact Factor from 1990-1992 to 1999-2001 is similar in the tour regions, i.e. 255 0% for China, 231 7% for Hong Kong, 217 8% for Singapore and 262 8% for Taiwan

The proportion of the publications with an Impact Factor Code 'A', or High Impact Factor, is 50 0% for Hong Kong, 48 5% for Singapore, 45 5% for Taiwan and 36 9% for China

After adjustment of the underlying population in each region, Hong Kong stands out to be most productive, followed by Singapore and Taiwan China for obvious reasons scores very low for the number of Medline publications adjusted for the underlying population

Impact Research Output

Number of full papers (with impact factor) in Medline by country

Number of full papers (with impact factor) in Medline by country / million population

Figure 6. Number of Medline publications published between 1990 and 2001. The number is given for China, Hong Kong, Singapore and Taiwan for all 12 years together, and for four three-year periods (eg. 1990-1992, etc). The total number of publications is given in the upper panel and per million population in the lower panel. Each bar has been divided into three groups of publications – a low, good and high Area Adjusted IF, as described on page 24.

31

Hong Kong Total Academic Output

In Figure 7 the total number of Medline publications (1990-2001) among Hong Kong institutions divided into the three IF categories, i.e. low, good and high (upper panel). The percentage above each bar represents the contribution made by each institution to the total Hong Kong publication number. The lower panel of Figure 7 gives the corresponding figures for the last three years (1999-2001) of comparison.

Among the various institutions in Hong Kong, The University of Hong Kong rates as number one considering the total number of Medline full publications from 1990 to 2001, representing 42.2%, i.e. 3.8% more than the runner-up, the Chinese University of Hong Kong. The remaining number of publications comes from non-academic institutions or organizations such as governmental hospitals and private hospitals (9.3%), with another 8.6% from other Hong Kong academic institutions. A similar rate of publication is also seen among the various Hong Kong institutions over the last three years (1999-2001), although the three universities without a Medical Faculty all increased their publication rate slightly against the two medical schools. However, the two medical schools together still account for the vast majority (77.7%) of the total number of Hong Kong publications.

The proportion of high Area Adjusted Impact Factor publications (Impact Factor Code 'A') among Hong Kong Institutions for the whole period of observation (1990-2001) is 70.9% for the Hong Kong University of Science and Technology (HKUST), 51.1% for HKU, 47.2% for Chinese University of Hong Kong (CUHK), 44.3% for Hong Kong Baptist University (HKBU), 43.5% for other and 34.1% for The Hong Kong Polytechnic University (PolyU). This percentages increased over the last three years (1999-2001) for all institutions except for the non-academic institutions (Other), showing a decreasing trend in the proportion of high Area Adjusted Impact Factor. The calculations are all based on the numbers provided in Figure 7.

Hong Kong Area Specific Academic Output

Figure 8 gives two different area listings in descending order; the number of publications with an IF value and the median Impact Factor for all Clinical and Pre-clinical publications identified. For definition of Clinical and Pre-clinical publication see Table 6, pages 38-39. The publications are those having 'Hong Kong' in the corresponding address field from 1999-2001. The number of publications is an important factor when considering the impact that a certain area has on the international scientific community. From this viewpoint, Surgery, Pharmacology and Pharmacy, and Oncology emerge on top. However, based on the rating of the median Impact Factor of those journals where the identified publications have appeared, the picture becomes quite different with Peripheral Vascular Disease, Virology and Reproductive Biology being the top three rated, while Surgery is relegated to 26th position with a median IF of 1.434.

Figure 7. The left graph gives the various areas in descending order, sorted by the number of publications with an IF with 'Hong Kong' in the corresponding address during the period 1990-2001. The right graph includes the areas in descending order sorted by the median Impact Factor of all Hong Kong publications between 1990 and 2001. The area listed are those given in bold in Table 6.

Figure 9 includes the same graph (lett) as in Figure 8, i.e. the total number of Medline full Hong Kong Clinical and Pre-clinical publications with an Impact Factor sorted in descending order. The right graph in Figure 9 gives the descending order of the Median Area Adjusted Impact Factor, i.e. the Median of the ranking % of all publications identified for Hong Kong in a certain area. The three top areas are Orthopedics, Reproductive Biology and Anesthesiology with Median Area Adjusted Impact Factors of 92.3%, 87.1% and 86.4%, respectively. These figures form a better basis for comparison between areas than a direct comparison of the Impact Factor, as provided by the Science Edition of the Journal Citation Reports.

The recommendation made here is that the overall impact of an area should be based on both the total number of publications and the value of the Area Adjusted Impact Factor

Hong Kong 1990 to 2001

Clinical and Pre-clinical Research Areas Number of published papers

Figure 9. The left graph gives in descending order the number of Hong Kong publications in Medline with an Impact Factor during the period 1990-2001. The right graph includes the areas sorted in descending order after the Median Area Adjusted IF, as previously described on page 24. The areas listed are given in bold in Table 6.

37

Area Specific Publication Impact

The remaining part of this report includes information about each of the areas listed with bold text in Table 6, representing the major areas in clinical and pre-clinical science research. One additional area has been included: the Multidisciplinary Sciences subject category. The reason for including this table is because the two most important journals in Pre-clinical Science – Nature and Science – are listed in this subject category.

The information of five other areas are not given in tables since the number of publications was still relatively small to provide any useful information. The five areas are Allergy, Aneshesiology, Biochemical Research Methods, Medical Laboratory Technology and Medicine, Research and Experimental.

The remaining selected areas are described in alphabetical order both by Table and Figures in the Appendix.

Table 6. This table gives all details for all Area specific publications identified in Medline between 1990 and 2001 with 'Hong Kong' in the corresponding address. All publications counted here were published in a journal listed in the Science Edition of the Journal Citation Reports for year 2000. The table gives the median Impact Factor given in various ways and the number of category A, B and C publications as well as the total number of publications. The areas given in bold represent the major areas of publication and are mostly clinically and pre-clinically oriented; these areas are the focus of the remaining part of this report.

Summary of Area Specific Publication Impact

Table 7 indicates the number of Medline publications produced by China, Hong Kong, Singapore, Taiwan with an impact factor published between January 1990 and November 2001. Only the major Clinical and Preclinical Science research areas, shown in bold in Table 6, have been listed and are in two groups -- namely Clinical Science and Pre-clinical Science. Each area is described in more detail in the Appendix in alphabetical order. As seen in Table 7, there is a large variation in the number of publications for each area, and a large variation of the proportion of the publications published in each region. However, Figure 10 gives the percentage for all Clinical Science publications and Pre-clinical Science publications, respectively, and the two combined for the region in Table 8. As can be seen from Figure 10, Taiwan had the largest proportion (49.8%) of identified publications in the Clinical Science area, followed by Hong Kong (24.3%), China (15.5%) and Singapore (10.4%). The findings are slightly different for the Pre-clinical Science area, where Taiwan made the largest contribution (42.3%) followed by China (33.7%), Hong Kong (15.0%) and Singapore (9.0%). Taking all areas together (Table 7 and Figure 10), Taiwan accounted for about 50 publications out of 100, China and Hong Kong had 20 publications each, and Singapore the remaining 10 publications.

Figure 10. The three charts include the percentage of all Clinical Science publications, Pre-clinical Science publications, and the two combined, respectively, for the four dominant Chinese populated regions. The details of the results are in Table 7.

Table 8 indicates the number of Medline publications with an impact factor published between January 1990 and November 2001 by Hong Kong institutions: namely the Chinese University of Hong Kong, The University of Hong Kong, other academic institutions and non-academic institutions or organizations. Each area is described in more detail in the Appendix in alphabetical order. Figure 11 indicates the proportions of Clinical Science publications and Pre-clinical Science publication areas respectively for each institutional group. The two institutions with medical faculties together account for 85.5% of Clinical Science output and 79.9% of Pre-clinical Science academic output in Hong Kong. The University of Hong Kong is rated number one in Clinical Science with 47.4% of the Hong Kong publications while the Chinese University of Hong Kong is the leading institution in Pre-clinical Science with 44.3% of the output. Table 8 indicates that The University of Hong Kong accounted for the largest number of publications in 19 out of 33 Clinical Science areas (57.6%) versus 9 for the Chinese University and one each for the other two institutional groups. The Chinese University had the largest number of publications in 6 out of 10 Pre-clinical Science areas (60.0%) versus three for The University of Hong Kong and one for other academic institutions. Taking all areas together (Table 8 and Figure 11) The University of Hong Kong accounted for 45 Hong Kong publications out of 100, the Chinese University of Hong Kong for 40 publications, other academic institutions for 6 and non-academic institutions for the remaining 9 publications.

Figure 11. The three charts include the percentages of all Clinical Science publications and the Pre-clinical Science publications, and the two combined, respectively, for Hong Kong institutions: namely the Chinese University of Hong Kong (CUHK), The University of Hong Kong (HKU), other academic institutions (Academia), and non-academic institutions or organizations (Other). Details of the results are in Table 8.

42

Table 8. The number of Medline publications with an impact factor published between January 1990 and November 2001 for Hong Kong institutions: the Chinese University of Hong Kong (CUHK), The University of Hong Kong (HKU), other academic institutions (Academia) and non-academic institutions or organizations (Other). Only life science areas are listed and they are given in two groups, namely Clinical Science and Preclinical Science. Bold figures represent the highest percentage within each area.

Table 9 provides the number of Medline publications with an impact factor published between January 1990 and November 2001 for The University of Hong Kong (HKU), compared with all Singaporean institutions taken together. Figure 12 highlights the main findings of this comparison -- that The University of Hong Kong had a higher publication rate during the 12 years of observation in Clinical Science than all Singaporean institutions taken together, 2,931 publications versus 2,630 publications. In the Pre-clinical Science area The University of Hong Kong had 704 versus 1,190 for all of Singapore.

Number of publications

Table 10 and Figure 13 indicate the number of Medline publications with an impact factor published between January 1990 and November 2001 for China, Hong Kong, Singapore and Taiwan. Only the total numbers of life science research areas were considered and are in two groups, namely Clinical Science and Pre-clinical Science. The figures are taken from Table 7 and the numbers have been divided by the total population of each region to produce a population-based adjusted (Adjusted) life science academic output; based on populations for China (1,261.5 million), Hong Kong (6.8 million), Singapore (4.1 million) and Taiwan (22.5 million). Table 10 and Figure 13 indicate that Hong Kong is the leader of the four when the number of publications is adjusted for the size of the population, both for Clinical Life Science and Pre-clinical Science. The runner-up is Singapore, followed by Taiwan. Based on the population-adjusted publication values, Hong Kong published 28% (1,202 versus 932 per million population) more publications in Clinical and Pre-clinical Science than Singapore and 48% (1,202 versus 811 per million population) more than Taiwan.

Table 10. The number of Medline publications with an impact factor published between January 1990 and November 2001 from China, Hong Kong, Singapore and Taiwan. Population-based adjusted life science academic output (Adjusted*); refers to the number of publications per million populations.

ang ta and to be an	China Publications			ng Kong blications		ngapore plications	Taiwan Publications

• Based on tigures from Table 7 Population of the four regions are China 1 261 5 million. Hong Kong 6.8 million. Singapore 4.1 million and Taiwan 22.5 million.

Figure 13. The figure gives the total number of Medline publications with an impact factor published between January 1990 and November 2001 from China, Hong Kong, Singapore and Taiwan. The figures are taken from Table 1 and the numbers have been divided by the total population in each region to produce a population-based adjusted (Adjusted) life science academic output; based on the populations of China (1,261.5 million), Hong Kong (6.8 million), Singapore (4.1 million) and Taiwan (22.5 million). As a contrast, the total number of publications is also provided per region in the figure.

Summary

The single most important component of a biotech company is human resources. No biotechnology industry can exist or advance without universities and their research excellence in both Clinical Science and Pre-clinical Science. In the initial phase of establishing a biotechnology industry in an emerging region, universities and university hospitals are the breeding ground for growth. This was the case in all established biotechnology regions and will continue to be so.

By the year 2020 it is estimated that predominantly Chinese communities will be the leading consumers of life science products world-wide, which explains the rapidly increasing interest in this market. Against this background, this study describes the life science academic output in Asia's four predominantly Chinese communities: China, Hong Kong, Singapore and Taiwan. The findings should be of value to academic institutions, the biotechnology industry and government bodies in their effective apportionment and investment of resources in the life science field.

The findings clearly establish that all four areas – China, Hong Kong, Taiwan and Singapore – are important emerging research centres for life science. All four already produce a respectable academic life science output. From a global perspective, they rank among the top 20 to 30 countries, behind the more established life science / biotechnology leaders: North America, Europe and Australia/New Zealand. In Asia, Japan and Israel also have a higher academic life science output than any of the four predominantly Chinese communities.

Taiwan is here shown to be producing the highest number of life science publications, followed by China, Hong Kong and Singapore. However, Hong Kong is the leading location of the four when output is adjusted for the size of the populations, both for Clinical Science and Pre-clinical Science. Based on population-adjusted publication values, Hong Kong produces 28% more publications in Clinical and Pre-clinical Science than Singapore, and 48% more than Taiwan.

China is strongest in Pre-clinical Science than Clinical Science, while the reverse is true for Hong Kong, compared to Singapore and Taiwan. This trend was also noted when the number of publications in 'very high impact' journals were counted; among the four, China accounted for 55% of the 'very high impact' Pre-clinical Science publications, while Hong Kong produced 55% of the 'very high impact' Clinical Science publications. Life science research collaborations are already strong between China and Hong Kong, and further integration seems likely to ensure even greater and faster success.

The two Hong Kong institutions with medical faculties – The University of Hong Kong (HKU) and the Chinese University of Hong Kong (CUHK) – account for 85% of the Clinical and Pre-clinical publications in Hong Kong, with HKU producing 45% and CUHK producing 40%. However, the margin widens when Clinical Science is considered in isolation, with HKU taking a 9% lead over CUHK.

Over the past decade Hong Kong and Singapore have competed to attract international pharmaceutical companies and life science investment – and become the leading centre for biotechnology development in Asia (outside Japan). From this study it is clear that Singapore falls short of Hong Kong, which has a strikingly superior life science academic performance. To cite just one example, The University of Hong Kong, one of the two medical institutions in Hong Kong, has a higher Clinical Science academic output than all institutions, hospitals and private organizations in Singapore put together. One explanation, perhaps, is that Hong Kong has two competing medical faculties, while Singapore only has one medical faculty. Excellence does not tend to develop without competition.

It is possible to formulate many recommendations or proposals on the basis of this study, but only one is made here. Hong Kong is in an extremely competitive position in the medical life science academic area -- not only in the region but also globally -- together with a uniquely strategic position in respect to China. Medical life science innovations and discoveries are known to emerge from medical universities and university hospitals. The Hong Kong SAR Government could capitalise on this resource. Hong Kong clearly has the infrastructure and human resources in place, but cannot expect to advance without appropriate funding.

Appendix

This appendix includes selected areas listed with bold text in Table 6 (page 38-39), representing the major areas in life science research.

The information of five other areas are not given in Tables since the number of publications is too small to provide any useful information. The five areas are Allergy, Anesthesiology, Biochemical Research Methods, Medical Laboratory Technology and Medicine, Research and Experimental.

Journals sorted according to the impact factor provided by the *Journal Citation Reports* (JCR) 2000 version for Multidisciplinary Sciences JCR subject category. The Area Adjusted Impact Factor (Adjusted IF) corresponds to the impact factor position in percentage of an individual journal among all the journals listed under the subject category: a journal with an adjusted IF between 67% to 100% represents a type A publication, 33% to 67% to a type B and 0% to 33% to a type C publication. The number of Medline publications published between January 1990 to November 2001 is quoted per journal for China, Hong Kong (HK), Singapore (SNG) and Taiwan (TW).

Biochemistry and Molecular Biology

Number of full papers (with impact factor) in Medline

Three year groups

12 year period - 1990 to 2001

China Hong Kong Singapore Taiwan

Biochemistry and Molecular Biology subject category. The number of Medline publications with an Impact Factor listed in the Journal Citation Reports 2000 version from 1990 to 2001 (12 year period) and for four three-year groups (1990-1992, etc). The upper panel is for China, Hong Kong, Singapore and Taiwan. The lower panel is for Hong Kong institutions; the Chinese University of Hong Kong (CUHK), The University of Hong Kong (HKU), other academic institutions (Academia) and non-academic institutions or organizations (Other). Journals sorted according to the impact factor provided by the *Journal Citation Reports* (JCR) 2000 version for Biochemistry and Molecular Biology JCR subject category. The Area Adjusted Impact Factor (Adjusted IF) corresponds to the impact factor position in percentage of an individual journal among all the journals listed under the subject category: a journal with an adjusted IF between 67% to 100% represents a type A publication, 33% to 67% to a type B and 0% to 33% to a type C publication. The number of Medline publications published between January 1990 to November 2001 is quoted per journal for China, Hong Kong (HK), Singapore (SNG) and Taiwan (TW). About 15 of the journals with the lowest IF with no publications have been omitted in the list.

Biotechnology and Applied Microbiology

Number of full papers (with impact factor) in Medline

Biotechnology and Applied Microbiology subject category. The number of Medline publications with an Impact Factor listed in the Journal Citation Reports 2000 version from 1990 to 2001 (12 year period) and for four three-year groups (1990-1992, etc). The upper panel is for China, Hong Kong, Singapore and Taiwan. The lower panel is for Hong Kong institutions; the Chinese University of Hong Kong (CUHK), The University of Hong Kong (HKU), other academic institutions (Academia) and non-academic institutions or organizations (Other). Journals sorted according to the impact factor provided by the *Journal Citation Reports* (JCR) 2000 version for Biotechnology and Applied Microbiology JCR subject category. The Area Adjusted impact factor (Adjusted IF) corresponds to the impact factor position in percentage of an individual journal among all the journals listed under the subject category: a journal with an Adjusted IF between 67% to 100% represents a type A publication, 33% to 67% to a type B and 0% to 33% to a type C publication. The number of Medline publications published between January 1990 to November 2001 is quoted per journal for China, Hong Kong (HK), Singapore (SNG) and Taiwan (TW). About 20 of the journals with the lowest IF with no publications have been omitted in the list.

Clinical Neurology subject category. The number of Medline publications with an Impact Factor listed in the Journal Citation Reports 2000 version from 1990 to 2001 (12 year period) and for four three-year groups (1990-1992, etc). The upper panel is for China, Hong Kong, Singapore and Taiwan. The lower panel is for Hong Kong institutions; the Chinese University of Hong Kong (CUHK), The University of Hong Kong (HKU), other academic institutions (Academia) and non-academic institutions or organizations (Other).

67

Journals sorted according to the impact factor provided by the *Journal Citation Reports* (JCR) 2000 version for Clinical Neurology JCR subject category. The Area Adjusted impact factor (Adjusted IF) corresponds to the impact factor position in percentage of an individual journal among all the journals listed under the subject category: a journal with an Adjusted IF between 67% to 100% represents a type A publication, 33% to 67% to a type B and 0% to 33% to a type C publication. The number of Medline publications published between January 1990 to November 2001 is quoted per journal for China, Hong Kong (HK), Singapore (SNG) and Taiwan (TW). About 20 of the journals with the lowest IF with no publications have been omitted in the list.

Gastroenterology and Hepatology

Number of full papers (with impact factor) in Medline

Gastroenterology and Hepatology subject category. The number of Medline publications with an Impact Factor listed in the Journal Citation Reports 2000 version from 1990 to 2001 (12 year period) and for four three-year groups (1990-1992, etc). The upper panel is for China, Hong Kong, Singapore and Taiwan. The lower panel is for Hong Kong institutions; the Chinese University of Hong Kong (CUHK), The University of Hong Kong (HKU), other academic institutions (Academia) and non-academic institutions or organizations (Other).

Journals sorted according to the impact factor provided by the Journal Citation Reports (JCR) 2000 version for Gastroenterology and Hepatology JCR subject category. The Area Adjusted impact factor (Adjusted IF) corresponds to the impact factor position in percentage of an individual journal among all the journals listed under the subject category a journal with an Adjusted IF between 67% to 100% represents a type A publication, 33% to 67% to a type B and 0% to 33% to a type C publication. The number of Medline publications published between January 1990 to November 2001 is quoted per journal for China, Hong Kong (HK), Singapore (SNG) and Taiwan (TW)

Genetics and Heredity subject category. The number of Medline publications with an Impact Factor listed in the Journal Citation Reports 2000 version from 1990 to 2001 (12 year period) and for four three-year groups (1990-1992, etc). The upper panel is for China, Hong Kong, Singapore and Taiwan. The lower panel is for Hong Kong institutions; the Chinese University of Hong Kong (CUHK), The University of Hong Kong (HKU), other academic institutions (Academia) and non-academic institutions or organizations (Other).

Journals sorted according to the impact factor provided by the *Journal Citation Reports* (JCR) 2000 version for Genetics & Heredity JCR subject category. The Area Adjusted impact factor (Adjusted IF) corresponds to the impact factor position in percentage of an individual journal among all the journals listed under the subject category: a journal with an Adjusted IF between 67% to 100% represents a type A publication, 33% to 67% to a type B and 0% to 33% to a type C publication. The number of Medline publications published between January 1990 to November 2001 is quoted per journal for China, Hong Kong (HK), Singapore (SNG) and Taiwan (TW). About 20 of the journals with the lowest IF with no publications have been omitted in the list.

Materials Science, Biomaterials

Number of full papers (with impact factor) in Medline

Materials Science, Biomaterials subject category. The number of Medline publications with an Impact Factor listed in the Journal Citation Reports 2000 version from 1990 to 2001 (12 year period) and for four three-year groups (1990-1992, etc). The upper panel is for China, Hong Kong, Singapore and Taiwan. The lower panel is for Hong Kong institutions; the Chinese University of Hong Kong (CUHK), The University of Hong Kong (HKU), other academic institutions (Academia) and non-academic institutions or organizations (Other).

Journals sorted according to the impact factor provided by the *Journal Citation Reports* (JCR) 2000 version for Materials Science, Biomaterials JCR subject category. The Area Adjusted impact factor (Adjusted IF) corresponds to the impact factor position in percentage of an individual journal among all the journals listed under the subject category a journal with an Adjusted IF between 67% to 100% represents a type A publication, 33% to 67% to a type B and 0% to 33% to a type C publication. The number of Medline publications published between January 1990 to November 2001 is quoted per journal for China, Hong Kong (HK), Singapore (SNG) and Taiwan (TW)

Number of full papers (with impact factor) in Medline

Nutrition and Dietetics subject category. The number of Medline publications with an Impact Factor listed in the Journal Citation Reports 2000 version from 1990 to 2001 (12 year period) and for four three-year groups (1990-1992, etc). The upper panel is for China, Hong Kong, Singapore and Taiwan. The lower panel is for Hong Kong institutions; the Chinese University of Hong Kong (CUHK), The University of Hong Kong (HKU), other academic institutions (Academia) and non-academic institutions or organizations (Other).

Journals sorted according to the impact factor provided by the Journal Citation Reports (JCR) 2000 version for Nutrition and Dietetics JCR subject category. The Area Adjusted impact factor (Adjusted IF) corresponds to the impact factor position in percentage of an individual journal among all the journals listed under the subject category: a journal with an Adjusted IF between 67% to 100% represents a type A publication, 33% to 67% to a type B and 0% to 33% to a type C publication. The number of Medline publications published between January 1990 to November 2001 is quoted per journal for China, Hong Kong (HK), Singapore (SNG) and Taiwan (TW).

Obstetrics and Gynecology subject category. The number of Medline publications with an Impact Factor listed in the Journal Citation Reports 2000 version from 1990 to 2001 (12 year period) and for four three-year groups (1990-1992, etc). The upper panel is for China, Hong Kong, Singapore and Taiwan. The lower panel is for Hong Kong institutions; the Chinese University of Hong Kong (CUHK), The University of Hong Kong (HKU), other academic institutions (Academia) and non-academic institutions or organizations (Other). Journals sorted according to the impact factor provided by the Journal Citation Reports (JCR) 2000 version for Obstetrics and Gynecology JCR subject category. The Area Adjusted impact factor (Adjusted IF) corresponds to the impact factor position in percentage of an individual journal among all the journals listed under the subject category a journal with an Adjusted IF between 67% to 100% represents a type A publication, 33% to 67% to a type B and 0% to 33% to a type C publication. The number of Medline publications published between January 1990 to November 2001 is quoted per journal for China, Hong Kong (HK), Singapore (SNG) and Taiwan (TW)

Journals sorted according to the impact factor provided by the *Journal Citation Reports* (JCR) 2000 version for Oncology JCR subject category. The Area Adjusted impact factor (Adjusted IF) corresponds to the impact factor position in percentage of an individual journal among all the journals listed under the subject category: a journal with an Adjusted IF between 67% to 100% represents a type A publication, 33% to 67% to a type B and 0% to 33% to a type C publication. The number of Medline publications published between January 1990 to November 2001 is quoted per journal for China, Hong Kong (HK), Singapore (SNG) and Taiwan (TW). About 10 of the journals with the lowest IF with no publications have been omitted in the list.

Otorhinolaryngology

Number of full papers (with impact factor) in Medline

12 year period - 1990 to 2001

China Hong Kong Singapore Taiwan

China Hong Kong Singapore Taiwan

Otorhinolaryngology subject category. The number of Medline publications with an Impact Factor listed in the Journal Citation Reports 2000 version from 1990 to 2001 (12 year period) and for four three-year groups (1990-1992, etc). The upper panel is for China, Hong Kong, Singapore and Taiwan. The lower panel is for Hong Kong institutions; the Chinese University of Hong Kong (CUHK), The University of Hong Kong (HKU), other academic institutions (Academia) and non-academic institutions or organizations (Other).

Journals sorted according to the impact factor provided by the *Journal Citation Reports* (JCR) 2000 version for Otorhinolaryngology JCR subject category. The Area Adjusted impact factor (Adjusted IF) corresponds to the impact factor position in percentage of an individual journal among all the journals listed under the subject category: a journal with an Adjusted IF between 67% to 100% represents a type A publication, 33% to 67% to a type B and 0% to 33% to a type C publication. The number of Medline publications published between January 1990 to November 2001 is quoted per journal for China, Hong Kong (HK), Singapore (SNG) and Taiwan (TW).

Number of full papers (with impact factor) in Medline

Taiwan Taiwan

Pharmacology and Pharmacy subject category. The number of Medline publications with an Impact Factor listed in the Journal Citation Reports 2000 version from 1990 to 2001 (12 year period) and for four three-year groups (1990-1992, etc). The upper panel is for China, Hong Kong, Singapore and Taiwan. The lower panel is for Hong Kong institutions; the Chinese University of Hong Kong (CUHK), The University of Hong Kong (HKU), other academic institutions (Academia) and non-academic institutions or organizations (Other).

Journals sorted according to the impact factor provided by the *Journal Citation Reports* (JCR) 2000 version for Pharmacology and Pharmacy JCR subject category. The Area Adjusted impact factor (Adjusted IF) corresponds to the impact factor position in percentage of an individual journal among all the journals listed under the subject category: a journal with an Adjusted IF between 67% to 100% represents a type A publication, 33% to 67% to a type B and 0% to 33% to a type C publication. The number of Medline publications published between January 1990 to November 2001 is quoted per journal for China, Hong Kong (HK), Singapore (SNG) and Taiwan (TW).

Psychiatry

Number of full papers (with impact factor) in Medline

Three year groups

12 year period - 1990 to 2001

Psychiatry subject category. The number of Medline publications with an Impact Factor listed in the Journal Citation Reports 2000 version from 1990 to 2001 (12 year period) and for four three-year groups (1990-1992, etc). The upper panel is for China, Hong Kong, Singapore and Taiwan. The lower panel is for Hong Kong institutions; the Chinese University of Hong Kong (CUHK), The University of Hong Kong (HKU), other academic institutions (Academia) and non-academic institutions or organizations (Other).

Journals sorted according to the impact factor provided by the *Journal Citation Reports* (JCR) 2000 version for Psychiatry JCR subject category. The Area Adjusted impact factor (Adjusted IF) corresponds to the impact factor position in percentage of an individual journal among all the journals listed under the subject category. a journal with an Adjusted IF between 67% to 100% represents a type A publication, 33% to 67% to a type B and 0% to 33% to a type C publication. The number of Medline publications published between January 1990 to November 2001 is quoted per journal for China, Hong Kong (HK), Singapore (SNG) and Taiwan (TW).

# Public, Environmental and Occupational Health

Number of full papers (with impact factor) in Medline

Taiwan

## Three year groups

China

### 12 year period - 1990 to 2001

Public, Environmental and Occupational Health subject category. The number of Medline publications with an Impact Factor listed in the Journal Citation Reports 2000 version from 1990 to 2001 (12 year period) and for four three-year groups (1990-1992, etc). The upper panel is for China, Hong Kong, Singapore and Taiwan. The lower panel is for Hong Kong institutions; the Chinese University of Hong Kong (CUHK), The University of Hong Kong (HKU), other academic institutions (Academia) and non-academic institutions or organizations (Other).

Journals sorted according to the impact factor provided by the *Journal Citation Reports* (JCR) 2000 version for Public, Environmental and Occupational Health JCR subject category. The Area Adjusted impact factor (Adjusted IF) corresponds to the impact factor position in percentage of an individual journal among all the journals listed under the subject category: a journal with an Adjusted IF between 67% to 100% represents a type A publication, 33% to 67% to a type B and 0% to 33% to a type C publication. The number of Medline publications published between January 1990 to November 2001 is quoted per journal for China, Hong Kong (HK), Singapore (SNG) and Taiwan (TW).

# Radiology, Nuclear Medicine and Medical Imaging

Number of full papers (with impact factor) in Medline

### Three year groups

### 12 year period - 1990 to 2001

Radiology, Nuclear Medicine and Medical Imaging subject category. The number of Medline publications with an Impact Factor listed in the Journal Citation Reports 2000 version from 1990 to 2001 (12 year period) and for four three-year groups (1990-1992, etc). The upper panel is for China, Hong Kong, Singapore and Taiwan. The lower panel is for Hong Kong institutions; the Chinese University of Hong Kong (CUHK), The University of Hong Kong (HKU), other academic institutions (Academia) and non-academic institutions or organizations (Other). Journals sorted according to the impact factor provided by the *Journal Citation Reports* (JCR) 2000 version for Radiology, Nuclear Medicine and Medical Imaging JCR subject category. The Area Adjusted impact factor (Adjusted IF) corresponds to the impact factor position in percentage of an individual journal among all the journals listed under the subject category: a journal with an Adjusted IF between 67% to 100% represents a type A publication, 33% to 67% to a type B and 0% to 33% to a type C publication. The number of Medline publications published between January 1990 to November 2001 is quoted per journal for China, Hong Kong (HK), Singapore (SNG) and Taiwan (TW).

Reproductive Biology subject category. The number of Medline publications with an Impact Factor listed in the Journal Citation Reports 2000 version from 1990 to 2001 (12 year period) and for four three-year groups (1990-1992, etc). The upper panel is for China, Hong Kong, Singapore and Taiwan. The lower panel is for Hong Kong institutions; the Chinese University of Hong Kong (CUHK), The University of Hong Kong (HKU), other academic institutions (Academia) and non-academic institutions or organizations (Other).

Journals sorted according to the impact factor provided by the *Journal Citation Reports* (JCR) 2000 version for Reproductive Biology JCR subject category. The Area Adjusted impact factor (Adjusted IF) corresponds to the impact factor position in percentage of an individual journal among all the journals listed under the subject category: a journal with an Adjusted IF between 67% to 100% represents a type A publication, 33% to 67% to a type B and 0% to 33% to a type C publication. The number of Medline publications published between January 1990 to November 2001 is quoted per journal for China, Hong Kong (HK), Singapore (SNG) and Taiwan (TW).

# Surgery

Number of full papers (with impact factor) in Medline

#### Three year groups

### 12 year period - 1990 to 2001

Surgery subject category. The number of Medline publications with an Impact Factor listed in the Journal Citation Reports 2000 version from 1990 to 2001 (12 year period) and for four three-year groups (1990-1992, etc). The upper panel is for China, Hong Kong, Singapore and Taiwan. The lower panel is for Hong Kong institutions; the Chinese University of Hong Kong (CUHK), The University of Hong Kong (HKU), other academic institutions (Academia) and non-academic institutions or organizations (Other).

Journals sorted according to the impact factor provided by the *Journal Citation Reports* (JCR) 2000 version for Surgery JCR subject category. The Area Adjusted impact factor (Adjusted IF) corresponds to the impact factor position in percentage of an individual journal among all the journals listed under the subject category: a journal with an Adjusted IF between 67% to 100% represents a type A publication, 33% to 67% to a type B and 0% to 33% to a type C publication. The number of Medline publications published between January 1990 to November 2001 is quoted per journal for China, Hong Kong (HK), Singapore (SNG) and Taiwan (TW).

| Subject Category, Area Tota

Toxicology subject category. The number of Medline publications with an Impact Factor listed in the Journal Citation Reports 2000 version from 1990 to 2001 (12 year period) and for four three-year groups (1990-1992, etc). The upper panel is for China, Hong Kong, Singapore and Taiwan. The lower panel is for Hong Kong institutions; the Chinese University of Hong Kong (CUHK), The University of Hong Kong (HKU), other academic institutions (Academia) and non-academic institutions or organizations (Other).

151

Journals sorted according to the impact factor provided by the *Journal Citation Reports* (JCR) 2000 version for Toxicology JCR subject category. The Area Adjusted impact factor (Adjusted IF) corresponds to the impact factor position in percentage of an individual journal among all the journals listed under the subject category: a journal with an Adjusted IF between 67% to 100% represents a type A publication, 33% to 67% to a type B and 0% to 33% to a type C publication. The number of Medline publications published between January 1990 to November 2001 is quoted per journal for China, Hong Kong (HK), Singapore (SNG) and Taiwan (TW).

Journals sorted according to the impact factor provided by the *Journal Citation Reports* (JCR) 2000 version for Transplantation JCR subject category. The Area Adjusted impact factor (Adjusted IF) corresponds to the impact factor position in percentage of an individual journal among all the journals listed under the subject category: a journal with an Adjusted IF between 67% to 100% represents a type A publication, 33% to 67% to a type B and 0% to 33% to a type C publication. The number of Medline publications published between January 1990 to November 2001 is quoted per journal for China, Hong Kong (HK), Singapore (SNG) and Taiwan (TW).

570.7205 K18 Karlberg, J. (Johan) Life science academic output in predominantly Chinese communities, 1990 to 2001 : China, Hong Kong, Singapore and Taiwan

About the Author:

Professor Johan PE Karlberg (BSc, MD, PhD) completed his undergraduate BSc. studies in Statistics and Education at the University of Goteborg, Goteborg, Sweden in 1970. This was followed by undergraduate and PhD studies in Medicine, and a period of 17 years of employment at the same institution. Professor Karlberg has published extensively on child growth and development research. He has also been a visiting researcher at Universities in England, US and Pakistan before taking up a post in the Department of Paediatrics, The University of Hong Kong in 1993. Professor Karlberg is the founder, and the current full-time Director, of the Clinical Trials Centre, The University of Hong Kong. The Centre is the first, and at present, the only faculty based central clinical trial organisation in Asia. During the first four years of the Centre's operation (1998-2002) around 100 trial contracts with most of the largest 25 international pharmaceutical companies have been signed. The Centre is also responsible for trial quality assurance issues as well as marketing activities. In addition, the Centre has also developed other clinical trial support services such as Project Management, Monitoring, Data Management, Medical Statistics and Central Laboratory Services.
